teil*, *urteil*, *urteil*, a judgment, decision), < *or-*, ac-
cented form of *ar-*, usually *a-* (see *a-1*), + *del*,
dal, a part, deal (or rather the base of the orig.
verb), with a suffix lost in AS., but retained in
OS. and OHG.; see *or-* and *del*. The tech-
nical use of the word, the disappearance of *or-* as
a significant prefix, and the remoteness of
the main element *del* from its etym. mean-
ing, led to a separation of the word from its
actual source, and its treatment as of L. orig-
in; hence the ordinary pron. in three syllab-
les (as if the termination were like that of *real*,
ideal, etc.), instead of the orig. two (ôr-dêl).]
I. *n.* 1. A form of trial to determine guilt or
innocence, formerly practised in Europe, and
still in parts of the East and by various savage
tribes. It consisted in testing the effect of fire, water,
poison, etc., upon the accused. Well known three-ordels in
England were the handling of red hot iron, or the walk-
ing over heated plowshares. A common form of the wa-
ter ordel was the casting of the accused into water; he
was considered innocent if he sank, guilty if he floated.
The practice of "ducking witches" is a survival of this
water-ordel, and the phrase "to go through fire and
water" probably alludes to those customs. These ordels
were abolished in England in the reign of Henry III., but
the usage of battle remained. The ordel of poison-water
is common in Africa; that of burning candles, in Burma.
that of eating rice, in Siam, etc.

By ordel or by oath,

(b) One of the several degrees or grades of the
clerical office. In the Roman Catholic Church these
orders are bishop, priest (presbyter), deacon, subdeacon,
acolyte, exorcist, reader, and doorkeeper. Originally the
first three were accounted *major orders* and the others
minor orders. Since the twelfth century the order of sub-
deacon has been advanced to the rank of a major order, and
the number of orders is generally counted as seven, the or-
ders of bishop and presbyter being regarded as one order
in so far as the sacerdotal character belongs to both. In
the Orthodox Greek and other Oriental churches the major
orders are those of bishop, priest, and deacon, and the
minor orders are subdeacon, reader (anagnost), and some-
times singer (psalter). The orders of bishop, priest, and
deacon are known not only as *major* or *holy orders*, but as
apostolic orders. The orders of subdeacon, acolyte, exorcist,
and doorkeeper (ordinary) existed in the Western Church
before the middle of the third century; those of subdeacon,
exorcist, reader, singer, and doorkeeper were as old as the
third or fourth century in the Eastern Church. The An-
glican Church retains only the orders of bishop, priest, and
deacon. Major orders can be conferred by bishops only.
Chorepiscopi, abbots, and priests have sometimes, how-
ever, been authorized to confer minor orders.

They cannot abide

Times' Whistle (E. E. T. S.), p. 14.

(c) In the Roman Catholic, Greek, Anglican,
and other episcopal churches, the sacrament
or rite of ordination, by which ecclesiastics re-
ceive the power and grace for the discharge of
their several functions; specifically termed *holy
order*, or more commonly *holy orders*. The bishop
alone can administer this rite. Orders as a sacrament or
sacramental rite are limited to the major orders.

5. (a) In *zool.*, that taxonomic group which
regularly comes next below the class and next
above the family, consisting of one or more
families, and forming a division (sometimes the
whole) of a class. Like other classificatory groups, it
has only an arbitrary or conventional taxonomic value.
Compare *superorder*, *suborder*. (b) In *bot.*, the most
important unit of classification above the ge-
nus, corresponding somewhat closely to *family*
in zoology. See *family*, 6. In phanerogams the
term *family* is not technical or systematic, being some-
times applied to suborders, tribes, or even genera. In
cryptogams it is made a subdivision of the order by some
authors. See *natural order*, under *natural*.

6. A number of persons of the same profes-
sion, occupation, or pursuits, constituting a
separate class in the community, or united by
some special interest.

common consent under the same religious, moral, or social
regulations; especially, a monastic society or fraternity;

ciscan order.

Shak., R. and J., v. 2. 4.

As a broad general rule, nearly every post-Reformation institute is styled not an *Order* but a "congregation"; but the only distinction which can be drawn between these two names is that *order* is the wider, and may include several congregations within itself (as the Benedictine *order*, for example, includes the congregations of Cluny and of St. Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.

Encyc. Brit., XVI. 715.

(b) An institution, partly imitated from the medieval and crusading orders of military monks, but generally founded by a sovereign, a national legislature, or a prince of high rank, for the purpose of rewarding meritorious service by the conferring of a dignity. Most honorary orders consist of several classes, known as *knights companions*, *officers*, *commanders*, *grand officers*, and *grand commanders*, otherwise called *grand cross* or *grand cordons*. Many orders have fewer classes, a few having only one. It is customary to divide honorary orders into three ranks: (1) Those which admit only nobles of the highest rank, and among foreign orders only sovereign princes or members of reigning families; of this character are the Golden Fleece (Austria and Spain), the Elephant (Denmark), and the Garter (Great Britain); it is usual to regard these three as the existing orders of highest dignity. (2) Those orders which are conferred upon members of noble families only, and sometimes because of the mere fact of noble birth, without special services. (3) The orders of merit, which are supposed to be conferred for services only. Of these the Legion of Honor is the best known type. Two of the orders of merit may be regarded as somewhat exceptional—the first class of the Order of St. George of Russia and the Order of Maria Theresa of Austria. The former is conferred only upon a commanding general who has defeated an army of 50,000 men, or captured the enemy's capital, or brought about an honorable peace. There is now no person living who has gained this distinction regularly, though it has been given to a foreign sovereign. Other orders of merit approach these more or less nearly, as they are conferred with more or less care. The various orders have their appropriate insignia, consisting usually of a collar of design peculiar to the order, a star, cross, jewel, badge, ribbon, or the like. It is common to speak of an order by its name alone, as the Garter, the Bath. An order is said to be *conferred* or *bestowed* upon the recipient of its distinction; the recipient is said to be *decorated* with such an order, and the word *order* is often applied to the decoration or badge. See *both, garter, knight, star, thistle*, etc.

10. In rhet., the placing of words and members in a sentence in such a manner as to contribute to force and beauty of expression, or to the clear illustration of the subject.—11. In classical arch., a column entire (including base, shaft, and capital), with a superincumbent entablature, viewed as forming an architectural whole or the characteristic element of a style. There are five orders—Doric, Ionic, Corinthian, Tuscan, and Composite. (See these adjectives.) Every order consists of two essential parts, a column and an entablature; the column is normally divided into three parts—base, shaft, and

capital; the entablature into three parts also—architrave, frieze, and cornice. The character of an order is displayed not only in its column, but in its general form and details, of which the column is, as it were, the regulator. The Tuscan and Composite are Roman orders, the other three are properly Greek, the Roman renderings of them being so different from the originals as to constitute in fact distinct orders. The Corinthian, though of purely Greek origin, did not come into extensive use before Roman authority was established throughout Greek lands.

The temple on the side of the river seems to be of the greatest antiquity, and was probably built before the orders were invented.

Pausanias, Description of the East, II. l. 135.

12. In math.: (a) In geometry, the degree of a geometrical form considered as a locus of points, or as determined by the degree of a locus of points. Newton introduced the term *order* as applied to plane curves. Cayley defines the *order* of a relation in m -dimensional space as follows: add to the conditions as many arbitrary linear conditions as are necessary to make the multiplicity of the relation equal to m ; then the number of points satisfying these conditions is the *order* of the relation. Thus, the *order* of a plane curve is the number of points (real and imaginary) in which this curve is cut by an arbitrary right line. The *order* of a non-plane curve is the number of points in which the curve is cut by a plane. The *order* of a surface is the number of points in which the surface is cut by a right line. The *order* of a congruence is the number of points in which the congruence lines lying in an arbitrary plane are cut by an arbitrary plane. The *order* of a complex is the number of points in which the curve enveloping the lines of the complex lying in an arbitrary plane is cut by an arbitrary plane. (b) In analysis, the number of elementary operations contained in a complex operation; also, that character of a quantity which corresponds to the degree of its algebraic expression. See the phrases below, and also *equation*.—13. Established rule, administration, system, or régime.

3. The established or due sequence; the appointed or fixed form; in the Roman Catholic missal and in other Latin liturgies, the established sequence or order for saying mass; the service of the mass (with exclusion of the canon) as preëminent; the *ordo*. In the medieval English liturgical books the Latin title was *Ordinarium* or *Canon Missæ*, the ordinary and canon of the mass; in the Roman missal and in general Latin use the title is *Ordo Missæ*, the order of the mass, and the *Canon Missæ*, canon of the mass, is entered as a new title. Hence some writers call only that part of the mass which precedes the canon the *ordinary* or *ordo*.

9. In *her.*, a very common bearing, usually bounded by straight lines, but sometimes by one of the heraldic lines, wavy, nebule, or the like. See *line*, 12. The ordinaries are the oldest bearings, and in general the oldest escutcheons are those which are charged only with the ordinaries, or with these primarily, other charges having been added. The bearings most generally admitted as ordinaries are the eight following: bar, bend, chevron, chief, cross, fesse, pale, and saltire; but most writers add one, some two, and others a greater number, namely one or more of the following: bend sinister, inescutcheon, quarter or franc quartier, pile, bordure. By some writers also the subordinaries and ordinaries are considered together under one head. The ordinaries are often called *honorable ordinaries*, to distinguish them from the subordinaries.

Bends, chevrons, and bars are three of the somewhat unimportant ordinaries, so called from their frequent use.

2. The act of admitting to holy orders, or to the Christian ministry; the rite of conferring holy orders or investing with ministerial or sacerdotal power and authority. In episcopal churches including the Roman Catholic Church, the Greek and other Oriental churches, and the Anglican Church, ordination consists in imposition of hands by a bishop upon the candidate, thus admitting him to one of the holy orders, and conferring on him the powers of that order and authority to perform its functions. The act of elevation to the episcopate is in strict technical use called *consecration*, not *ordination*. *Ordination* in its widest sense includes admission to the minor orders, which are usually conferred in the Roman Catholic Church by a bishop, but can be bestowed by an abbot, the act of admission consisting in the tradition (delivery) of the instruments. In Presbyterian churches the power of ordination rests with the presbytery, who appoint one or more of their number to conduct the ordination ceremonies, which include laying on of hands. In Congregational and Baptist churches ordination is customarily performed by the pastors of other churches (of the same denomination), but is regarded as necessary only for the preservation of church order, and the service is regarded as conferring no special religious authority. See *institution*, *ordination*, *ordination*.

As for *Ordination*, what is it but the laying on of hands,

ordnance (ôr'dnans), *n.* [An old form of *ordnance*: see *ordnance*, *v.* (*cf. ordnance*).] Cannon or great guns collectively, including mortars and howitzers; artillery. As a technical term, it designates all heavy pieces fired from carriages. Modern ordnance may be divided into two classes, *smooth bore* and *rifled*. The former are all muzzle-loaders, the latter are subdivided into *muzzle-loaders* and *breech-loaders*. Most guns of modern construction are breech-loading rifled arms. Classified according to the material used, cannon are *bronze* and *iron*, wrought iron, steel, or mixed cast (wrought-iron and steel) guns, according to the method of construction, they are called *solid* or *built-up* guns. The most modern type of heavy gun is an all-steel built-up breech-loading gun, with a Krupp or interrupted screw femture. Formerly sometimes used in the plural.

Board of ordnance. (a) Formerly, in Great Britain, a board, consisting of a master-general, surveyor-general, clerk, and storekeeper (usually members of Parliament), which provided the army and navy with guns, ammunition, and arms of every description, and superintended the providing of stores, equipment, etc. The Crimean disaster in 1854 showed the defects of this board, which was shortly afterward dissolved. (b) A board composed of United States ordnance officers distinguished for their attainments in the theory and practice of heavy ordnance. Its construction and use, whose duty it is to conduct experiments, and test and report upon all ordnance subjects referred to it by the chief of ordnance. This board is designated by the Secretary of War, and is advisory to the chief of ordnance of the army. — **Bureau of Ordnance**. See *Department of the Navy, under department*. — **Master of the ordnance**. See *master*. — **Ordnance corps**. Same as *ordnance department*. — **Ordnance department**. See *department*. — **Ordnance storekeeper**. See *storekeeper*. — **Ordnance stores**, a general phrase including everything pertaining to the manufacture, equipment, and service of ordnance or artillery. It comprises all projectiles and explosives, pyrotechnic stores, gun-carriages, caissons, limbers, mortar-beds, cavalry and artillery horses, battery wagons, and all machines for forging and rolling munitions and for transportation. Tools and materials for fabrication, repair, or preservation, all small-arms, accoutrements, and equipments for artillery, cavalry, and infantry. The phrase "ordnance and ordnance stores" covers everything in the form of a weapon that is used in war, together with all the materials and appliances necessary for their construction, repair, preservation, and use. — **Ordnance survey**, the survey of Great Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties, and rivers, roads, houses, etc., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is for towns having 4,000 or more inhabitants, 1 in. of the linear measure being equivalent to 25,122 inches to a mile, or 1 inch to 41,272 feet; for parishes (in cultivated districts), 1 in. of the linear measurement, equal to 27,343 inches to a mile, or very nearly 1 square inch to an acre, for counties, 6 inches to a mile. For the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be levied and roads, railways, canals and other public works laid out and executed. — **Rifled ordnance**. See *rifled cannon*, under *cannon*.

Ordovician (ôr'do-vish'ian), *a.* [Named from the *Ordovices*, an ancient British (North Welsh) tribe.] An epithet applied by C. Lapworth to a series of rocks not capable of exact separation from those underlying or overlying them, either stratigraphically or paleontologically, but which have been the subject of much discussion among English geologists. They form a part of the Lower Silurian of Murchison, more or less of the Upper Cambrian of Sedgwick, the Cambro-Silurian of Jukes, the Siluro-Cambrian of some authors, the second fauna of Burman, etc. As limited in Wales, according to H. R. Woodward, the Ordovician may be said to extend from the base of the Arenig series to the base of the Harford. Graptolites and trilobites are the most abundant fossils, and there is a large amount of intercalated volcanic material. The name Ordovician does not appear in the text book of geology recently issued by the director of the Geological Survey of Great Britain, nor has it any place in American Silurian geology as worked out by the New York and Pennsylvania surveys, nor can the strata thus named in England be strictly paralleled with any one or more divisions of the Silurian as established in the United States.

Skt. aya*, metal.] 1. A metalliferous mineral or rock, especially one which is of sufficient value to be mined. A mixture of a native metal with rock or veinstone is not usually called *ore*, however, it being understood that in an ore proper the metal is in a mineralized condition, that is, exists in combination with some mineralizer, as sulphur or oxygen. The ore and veinstone together constitute the mass of the metalliferous deposit, vein or lode. The *ore* as mined is usually more or less mixed with veinstone, and from this it is separated, as completely as may be convenient or possible, by dressing. It then usually goes to the smelter, who, by means of a more or less complicated series of operations, frees it from the worthless material which still remains mechanically mixed with it, and also sets it free from its chemical combination with the substances by which it is mineralized.

2. Metal; sometimes, specifically, a precious metal, as gold.

It is quite frequently more or less pulverulent, staining the hands deep red, hence called *dyestuff ore*. The Clinton ore is of great economical importance, but has the defect of containing considerable phosphoric acid. Also called *passat ore*. **Coral ore.** See *coral*. **Float-ore.** Same as *float-sandstone*. **Graphic ore.** Same as *graphical gold* (which see under *gold*). **Gray, horse-flesh, morass, etc., ore.** See the qualifying words. **Mock ore, blende.** **Peacock ore.** Same as *crucianite*. **Round ore.** Same as *leop ore*. A genus of aretid moths of the restricted family
Liparidae, the males of which fly by day with a
vaporizing kind of motion, and hence are called
vaporers or *vaporer-moths*. They are also known as
tumet-moths, from the long tufts of hair with which the
caterpillars are furnished. The females are incapable of
flight, having only rudimentary wings. In the
male the body is slender;
the proboscis is short; the
palpi are short and very
hairy, with the third joint
shortest; the antennae are
broadly pectinate; the
hind tibiae have two short
apical spurs, or four long
ones; and the wings are
broad, extending beyond
the end of the abdomen.
The larvae are elongate and
tuberculate, usually with*

two long pencils of hair on the prothorax and anal segments; they spin a slight cocoon above-ground. The genus is represented in all the Old World countries, and has nine North American members. The male of *O. gemma*, the common vapor, is a small brown moth with a white spot on the edge of the fore wings. *O. communis* is the most common moth. *O. fuscinus* is the dark tussock-moth. *O. leucostigma*, the white marked tussock-moth, is very troublesome in the streets of many cities of the United States, injuring shade-trees. There are probably many more species than have thus far been determined. *O. ciliatus* is a useful mite, which feeds on the eggs of the cankerworm-moth in the United States. Also *Oribatida*.

None is parasitic at any age, or specially injurious, and some are beneficial. About 12 genera are described. The *Oribatida* are sometimes divided into 2 subfamilies, *Phytogasterinae* or *Oribatinae* proper, and *Opatogasterinae*, the latter containing 9 genera.

orichalc (ô-ri-kalk), *n.* [Formerly also *orichalc*; = *P. orichalc* = *Sp. Pg. It. orichalc*, < L. *orichalcum* (also erroneously *aurichalcum*, simulating *aurum*, gold), < Gr. *ôp. rûzâk*, rarely *ôp. rûzâk*, yellow copper ore, brass, lit. 'mountain-copper,' < *ôp. rûzâk*, mountain, + *rûzâk*, copper; see *chalcite*.] The equivalent in English of the Greek *ôp. rûzâk*, the name of a metallic alloy or metal of brilliant luster, mentioned by Greek authors of a very early date, and considered by them as worthy to be classed with gold and silver in respect of value. Plato, while often speaking of it, admits that our knowledge was no longer to be had in his time, and some (Aristotle). It is said, among them, deny that any such metal ever existed. The word passed into Latin under the form of *orichalcum*, and later that of *aurichalcum*. Although sometimes used as the name of brass (as by Strabo, who, with as near an approach to accuracy as was possible in those days, describes the method of manufacturing that metal and calls the alloy *orichalcum*), it had in general even down to the middle ages—a more or less uncertain meaning, standing sometimes for an entirely ideal and very precious substance and sometimes for an ordinary metal or alloy (as copper or bronze), but having a peculiar value on account of the manner in which it was made or the locality whence it came.

The metal was of rare and passing price.
Not billon steel, nor brass from Corinth set,
Nor costly *Orichalc* from strange Phœnice,
But such as could both Phœbus arrow—sail,
And th' hailing darts of heaven beat—hard.

gold; see *aurus*, *aurus*, and cf. *orialis*.] A portico, recess, or small room forming a projection from a room or building, as a hall or chapel, in the form of a large bay or recessed window, and often more richly furnished or more private than the rest of the room or building, formerly used as a boudoir, closet, and separate apartment for various purposes. It projects from the outer face of the wall, being in plan semi-hexagonal, semi-octagonal, or rectangular, etc., and is supported on brackets, corbels, or corbeling. When such a projecting feature rests upon the ground, as directly upon the foundation of the building, it is called a *bay-window*, or a *bow-window*. Also called *oriel window*.

Specifically: (a) The position of worshippers facing toward the east, or, in Christian worship, toward that end of a church which is known as the eastern end, especially (*eccles.*) that position of a priest celebrating the eucharist in which he faces the altar, the eastward position.

E. B. Tylor, *Prim. Culture*, II. 382.

(c) The construction or position of a church so that it has that end which contains the chancel or sanctuary in the direction of the east.

The very ancient practice of *orientation* in the building of churches can hardly be set aside as "a High Church piece of pedantry." Allusion to worship towards the east may be found in the early liturgies and Church fathers, and in this country, at least, *orientation* has been practiced from the first introduction of Christianity into these islands down to the present time, with the interruption of the Great Rebellion.

N. and Q., 7th ser., VII. 466.

(d) Hence, the position of a building or of any object with reference to any point of the compass.

But let a man venture into an unfamiliar field, or where his results are not continually checked by experience, and all history shows that the most masculine intellect will oftentimes lose his *orientation* and waste his efforts in directions which bring him no nearer to his goal, or even carry him entirely astray. *C. S. Peirce*, in *Pop. Sci. Mo.*, XII. 4.

In *zoöl.*, the faculty or instinct by which birds and other animals find their way home after being carried to a distance. It is well illustrated by homing pigeons. (See *homing*.) A striking instance of orientation is also afforded by swallows. Thus, a swallow nesting in New England, for example, and wintering in Panama, can return to the latter in the barn where its nest was the previous year. All the regular and periodical migrations of birds imply the faculty of orientation.

See *marjoram*, also *ditany*, 2, and *hop-marjoram*.—*Oil of origanum*, *marjoram-oil*.

Origenism (or-i-jen-izm), *n.* [*< Origen* (see def.) + *-ism*.] The opinions held by or attributed to the Greek father Origen of Alexandria (born about A. D. 185, died about 253). The main characteristics of Origen's teaching were its union of philosophical speculation with Christian doctrine and its mystical and allegorizing interpretation of Scripture. He insisted especially on the unity of all creation; he regarded Scripture as having generally a threefold sense, literal, moral, and mystical; he held the essential divinity and eternity of each person of the Trinity, but maintained that the Son is inferior to the Father and the Holy Ghost to the Son; he was the first to formulate the orthodox doctrine of eternal generation; he rejected prayer to Christ, though he defended prayer in the name of Christ; he regarded all sin as proceeding from a voluntary and moral self-determination to evil; he held that the human soul of Christ preexisted with other human souls; that the soul came into the body as a penalty for sin in a preexistent state, and he believed in a further moral progress and development after the present life, and deduced as a probable opinion the restoration and final salvation of all men and of the fallen angels.

Original Nation, Indigenous, Aboriginal.* The original inhabitants of a country are those who were there first, whether native or not. The native inhabitants of a country are those who were born there, as opposed to immigrants.—*a. or those foreign-born.* Indigenous sounds somewhat strange as applied to races, because the actual origination of a race in a given region is rarely ascertained or discussed. The word is often used literally of vegetable products attuned to a region, and sometimes metaphorically of feelings native to man: as such it is opposed to *exotic*; as, the potato is believed to be indigenous, or native, to Peru. *Aboriginal* is used of human beings: the *aboriginal* inhabitants of a country are those that are found occupying the country by civilized discoverers: the North American Indians were the *aboriginal* or *aboriginal* inhabitants of the country, before believed to have been preceded by a race not themselves indigenous, nor perhaps the *original* occupants of the soil. See *primary*.—2. Inventive, creative.

Where the ortho-acid has not been isolated, the acid in which the number of hydroxyl groups present is nearest to the number expressing the quantitative of the elementary radical is sometimes called an ortho-acid.

They are among the most profusely and widely distributed shells of the old rocks. They attained greater size than any other fossil of the time, some fragments having been found which indicate a length of 6 feet.

orthochromatic (ôr-thô-kro-mat'ik), *a.* [*Gr. ortho*, correct, + *chroma*, color: see *chromatic*.] In *photog.*, correct in the relations or in the rendering of colors—that is, free from the usual photographic fault of exaggerating the deepness of greens, yellows, and reds and the brightness of blues and violets. The epithet notes any process by means of which this end may be attained, as any plate, chemical, etc., used in such a process. Ordinary photographic dry plates in which a trace of such agents as cyan or chlorophyll is incorporated possess the orthochromatic property, which is greatly enhanced if the exposure is made through a transparent screen tinted to correspond with the prevalent color in the scene or picture, as green for a landscape, or yellow for a painting characterized by draperies of that hue. Also expressed by *isochromatic*, an epithet implying equality of exposure to obtain similar results from opposed colors, contrary to the usual photographic experience.

orthochromatize (ôr-thô-kro-mat'iz), *v. t.; pret. and pp. orthochromatized, ppr. orthochromatizing.* [*Gr. orthochromatize* + *-ize*.] In *photog.*, to render orthochromatic, as a plate; bring into conformity with the conditions necessary to obtain a correct rendering of color-values.

orthoclase (ôr-thô-klas), *n.* [*Gr. ortho*, straight, right, + *klasis*, fracture: see *clastic*.] Common or potash feldspar, a silicate of aluminum and potassium, occurring in monoclinic crystals and also massive. It has two perfect cleavages at right angles to each other (whence the name). It varies much in color, from white to yellow, red, and green. Adularia, including most moonstone, is a crystallized variety, transparent or nearly so, characteristic especially of the crystalline rocks of the Alps; valencianite, from Valencian, Mexico, is similar to it. Adularia is a glassy variety, usually containing more or less soda; it is characteristic of certain igneous rocks, as trachyte, phonolite, etc.; adularite, from Monte Somma, Vesuvius, is similar. Adularia is a variety from Hammond, New York, and muscovite one from Exeter, England; the latter showing golden-yellow reflections on a surface nearly parallel to the orthoclase. Orthoclase is an essential constituent of granite and some other crystalline rocks, and often occurs in large masses in granite veins and is then quarried and used in making pottery. Much of the potash feldspar called orthoclase is really the related triclinic species *microcline*. The name *orthoclase* has been given to some kinds of triclinic feldspar containing considerable potash, which are more closely related to albite than to microcline in optical characters. See *feldspar*. Also called *orthon*.

orthoclastic (ôr-thô-klas'tik), *a.* [*Gr. ortho*, straight, right, + *klasis*, verbal adj. of *klao*, break.] Characterized by cleavages at right angles to one another: said of certain species of the feldspar group, particularly orthoclase; pertaining to such species, or specifically to orthoclase.

Orthocoma (ôr-thô-sê-ma), *n. pl.* [NL.: *Gr. ortho*, straight, + *komê*, hollow.] One of three orders into which the rhadoculous turbellarians are sometimes divided.

orthodagonal (ôr-thô-di-âg'ô-nal), *n. and a.* [*Gr. ortho*, straight, + *diagonos*, diagonal: see *diagonal*.] *I. n.* In *crystal.*, the diagonal or lateral axis in a monoclinic solid which is at right angles with the vertical axis; also, the plane which includes the two axes named.

II. a. Pertaining to or in the direction of the orthodagonal.

orthodomatic (ôr-thô-dô-mat'ik), *a.* [*Gr. ortho*, straight, + *domos*, house: see *dome*, 5.] Pertaining to or in the direction of an orthodome.

orthodome (ôr-thô-dôm), *n.* [*Gr. ortho*, straight, + *domos*, house: see *dome*, 5.] In *crystal.*, a dome, in the monoclinic system, parallel to that lateral axis which is at right angles to the vertical axis. It is properly a hemidome, since a given form includes but two planes. See *dome*, 5.

orthodox (ôr-thô-doks), *a.* [= *F. orthodox* = *Sp. ortodoxo* = *Fr. orthodoxe* = *It. ortodossu*, *Gr. ortho*, straight, + *doxa*, opinion, having a right opinion, *Gr. ortho*, straight, right, correct, + *doxa*, opinion: see *dogma*, *dogmology*.] 1. Holding what is regarded as the correct opinion, or correct opinions, especially in regard to religious or theological doctrines; sound in opinion or doctrine; specifically, conforming to the faith of the Church Catholic, as represented in its primitive ecumenical creeds: applied to persons or doctrines. That which seems to one part of the Christian church orthodox may be held by another to be heterodox. Thus, the Roman Catholic Church regards Protestant churches as heterodox, again, the Reformed churches sometimes deny the title *orthodox* to one another; and generally those who hold to the Trinitarian faith deny the epithet *orthodox* to the Unitarians and Universalists. Orthodoxy is not usually denied to those who are charged with having added articles to the ecumenical faith of Christendom, but only to those who are charged with denying a part of that faith. Thus, the Roman Catholic is not ordinarily refused by Protestants the right to the epithet *orthodox*; nor are Unitarians denied the right to that epithet by those of Unitarian belief. *Orthodox* is the common epithet of the Greek Church (of which the full official title is "the Holy Orthodox Catholic Apostolic Oriental Church"), as *Catholic* is of the Roman Church. (The word is employed locally in New England to designate the Trinitarian congregational churches distinguished from those of the same order which hold the Unitarian or Universalist faith, as in the phrase "the Orthodox Church.") It is also used to distinguish the Trinitarian quakers from those whose belief is or tends toward Unitarianism.

— *The Orthodox Tenet*, that there never was any redemption of mine but by the blood of the Lamb that was slain from the beginning of the world.

Milton, Ann. to St. Matthew, Works, III, 162.

Orthodox, orthodox.

Who believe in John Knox.

Let me sound an alarm to your conscience.

Burns, The Kirk's Alarm.

2. [*cap.*] Of or pertaining to the Greek Church.

The Orthodox population in Cuthbert and all the counties thereof is always a large minority, and in some places it actually outnumbers the Latins.

P. A. Freeman, Venice, p. 136.

Orthodox school, in *polit. econ.* See *political*—*Syn.* 1. *Orthodox, Evangelical*. (See the definitions of those terms.) It is natural for all who care about their doctrinal beliefs to claim the titles that indicate correctness of belief. Hence *orthodox* is a part of the name of the Greek Church; to the Roman Catholic *orthodox* means faithful to the tenets of the Roman Church. In the doctrinal contests of America *orthodox* has generally meant Calvinistic especially as opposed to Unitarianism and Universalism; in England it has as generally meant High Church, as opposed to Low Church or Evangelical. *Evangelical*, meaning in harmony with the Gospel, has been claimed somewhat similarly and for a like reason but has been especially applied to those who emphasize the doctrine of salvation by faith in Christ alone.

The order as now understood contains insects in which metamorphosis is incomplete and wings are almost always present, of which the hinder pair are dilated, folded from the base, and of membranous texture, while the fore pair are more or less coriaceous, usually narrow and straight (but variable in this respect), and thickly veined. These insects are active and capable of feeding in all stages from birth to death. Seven families, or, as some consider, tribes or superfamilies, are now recognized. The *Orthoptera* are in the main herbivorous, but the *Mauididae* are carnivorous, and some of the *Blattellidae* are omnivorous. They are found all over the world, but most numerous in the tropics, where among them are the largest known representatives of the whole insect class. All the known species are terrestrial or arboreal, no aquatic forms having been discovered; and according to their habitual mode of progression the families have been grouped by *Westwood* as *Currieria*, *Raphidia*, *Ambulatoria*, and *Saltatoria*. The *Orthoptera* are among the earliest forms of insect life to appear in geologic time, and the *Blattellidae* in particular are very numerous in some geological formations. The main characters used in classifying the *Orthoptera* are derived from the modifications of the genitalia, mouth-parts, and antennae. Thus the compound *tribh* (tribh) with an accent on *tribh* (tribh) is accented (in *orthotonical* accentuation), whereas the same compound, used as a verbal noun (tribh) (tribh) takes the accent on *tribh*. — *Four Philol.*, VI, 212.

These words, as well as *oryctographie*, were comparatively extensively used by

Continental geologists, in the early part of the nineteenth century, with a meaning nearly equivalent to what is now comprehended under the terms *mineralogy* and *petrology*, and this also included more or less, according to the views of various authors, of economical and mining or "applied" geology. [*< L. osculatus, pp. of osculari, kiss, < osculum, a little mouth, a pretty mouth, a kiss, dim. of os, a mouth: see os², oral, etc.*] 1. *trans.* 1. To salute with a kiss; kiss. *Imp. Dict.*—2. In *geom.*, to have a higher contact with; touch as closely as possible. Thus, a plane or a circle is said to osculate a curve when it has three coincident points in common with the curve that is, it occupies such a position (and in the case of the circle has such a size) that as it is brought up into this position three points of intersection with the curve run into one. A sphere is said to osculate a tortuous curve when it has four coincident points in common with the curve. In these cases, to osculate means to have the greatest number of coincident and successive points common to a fixed locus which is compatible with the general character of the locus which osculates; and some geometers restrict the word to this meaning. This meaning is also extended to time; thus, the *osculating* elements of a planet are those elliptic elements which would satisfy three exact observations made at times infinitely little removed from a given epoch. But *osculate* is also used loosely to mean merely that the loci in question have three or more coincident points in common. A tangent linear plane is never said to osculate a curve or surface unless it has more than ordinary contact with it.

II. intrans. 1. To kiss one another; kiss. *Imp. Dict.*—2. In *geom.*, to have, as two loci, three or more coincident and successive points in common. See 1., 2.—3. With him was formally identified every departed soul in the nether abode, to be protected by him in the necessary conflict with the genius of evil. The worship of Osiris was extended, at about the beginning of the Christian era, over Asia Minor, Greece, and Rome. In art Osiris is usually represented as a mummy, wearing the crown of Upper Egypt, often flanked by ostrich-plumes. The accompanying cut represents a bronze figure in the Metropolitan Museum of Art, New York.

In the form of osmium, an alloy of the metals osmium and iridium. The specific gravity of the artificially obtained metal has been found to be 21.47; hence it is the heaviest of those bodies. It has never been fused. Its crystalline form is either that of the cube or that of a very obtuse rhombohedron. It is a kind of diffusion (see *diffusion*), and includes *endosmosis* and *exosmosis*. The former being distinguished either as the tendency of the outer fluid to pass through into the inner, or as the action of that fluid which passes with the greater rapidity into the other. When two saline solutions differing in strength and composition are separated by a porous diaphragm or septum of bladder, parchment-paper, or porous earthenware, they mutually pass through and mix with each other; but they pass with unequal rapidity, so that after a time the height of the liquid is not the same on both sides. These phenomena are explained by the unequal molecular attraction exerted between the capillary apertures in the porous diaphragm and the different liquids experimented upon.

Otolith (ō-tō-lith), n. [C. < Gr. *ōtis* (ōtid-), ear, + *lithos*, stone.] 1. A calcareous concretion within the membranous labyrinth of the ear. In fishes and fish-like vertebrates they are sometimes of great size. In higher animals otoliths are generally wanting or reduced to small particles or ear dust (see *otoconium*). Among some common fishes the otolith decreases in size in the following order: cod, hake, haddock, whiting, conger, turbot, sole, guinea, snail, and trout. The conchoid shells differ much in shape. In the conger the otolith is shaped like a scale, 1 1/2 inches long, 1 inch wide, and is thin and glassy. In the cod it is of the size of a horse-bean, and is curved on itself. The ear stones of the American sheephead are shaped like a tamarind seed, and look like pieces of milky quartz. They are often carried in the pocket as "lucky stones."

2. One of the proper otic bones of some animals, as certain fishes; an otocoon. See cuts under *Fox* and *Python*. = *Syn.* *Otolithus*, *Otolite*, *Otocoon*, and *Otocystis* are all confusable in the human ear; the two first mentioned words are by some restricted to the large solid "ear stones" of lower animals, while the latter two designate the small ones or very fine "ear dust" of higher animals. They have properly no part in the bony structure of the ear, but a vibratory or conservative function in audition. But *otolith* and *otocoon* are sometimes applied to the internal ear-bones of fishes.

The common river otter, the *Lutra europæica* of Europe, is a quadruped adapted to amphibious habits by its short, strong, flexible palinated feet, which serve as oars to propel it through the water, and by its long and strong tail, which acts as a powerful rudder, and enables the animal to change its course with great ease and rapidity. It inhabits the banks of rivers, and feeds principally on fish. When its retreat is found, the otter instantly takes the water and dives, remaining a long time underneath it, and rising at a considerable distance from the place where it dived. The weight of a full grown male is from 30 to 35 pounds, and its length is about 2 feet exclusive of the tail. In many parts of England, and especially in Wales, the otter is hunted with dogs trained for this purpose. The other species of *Lutra* proper, which are found in different parts of the world, do not differ greatly from the European otter. outcrop (out-'krop), *n.* The appearing at the
 surface of a stratum or series of strata, or of a

 metallic vein or lode is frequently more or less con-
 cealed by the accumulation of partly decomposed mate-
 rial (see *mass*), the result of the decomposition and
 oxidation of the metallic part of the lode by atmo-
 spheric agencies. This is called by Cornish miners the
breast. The outcrops of many veins, on the other hand,
 are very conspicuous, especially when the amount of ore
 present is small, quartz forming the predominating vein-
 stone of a large proportion of the mineral deposits, and
 being very indurated. The outcrops of the stratified
 formations depend on the amount of inclination of the
 beds. When these lie quite horizontal, there can be no
 outcropping edges of the strata, except when the forma-
 tion has been cut into by erosion. The position on the
 surface of any outcrop depends, therefore, on the inclina-
 tion of the bed or vein in question, and on the nature and
 amount of the erosion which has taken place. See *cut*
 under *dip*.

Outline is literally the outer or exterior line; but the word is freely used for a representation by the principal or distinguishing lines. Contour and profile retain this distinctive meaning of the outline line, the former referring to the boundary of the whole figure in any position, and the latter to the boundary of face or figure when seen directly from one side, with figurative uses in architecture and surveying. A sketch fills up the outline in greater or less degree, but completely but so that a lively idea of the original object or person is conveyed. Delineation is rather indefinite, but less than an outline and may be complete. The line, sketch, and delineation bear the same relation to one another when used to express the representation of a subject in words.

That part of a female animal in which ova, eggs, or germs are generated and matured; the essential female organ of reproduction, corresponding to the testes of the male; the female genital gland or germ-gland; the ovarium. In vertebrates the ovary is a glandular organ, usually paired, sometimes single, and morphologically identical with the testes, both these organs being developed from a primitively indifferent genital gland common to both sexes, the differentiation of this structure into ovary or testes being the fundamental distinction of sex upon which all other sexual differences are consequent. The ovary consists of its proper stroma or tissue peculiar to itself, in which the ova are produced, bound up in ordinary connective tissue, supplied with appropriate vessels or nerves, and fixed in the abdominal cavity by means of a mesentery. With the ovary is usually but not always associated a special structure, the *oviduct*, serving to convey away the eggs. The ovary is relatively largest in those animals which lay multiovular eggs, as fishes, in which it is known as the *roe*. It is also large in oviparous animals which lay large meroblastic eggs with copious food yolk, as birds and most reptiles. It is very small in mammals. The ovary in woman is a flattened ovoid body about 1½ inches long, 1 inch wide, and ½ inch thick, resting on the broad ligament of the uterus and closely connected both with that organ and with the Fallopian tube or oviduct. Among invertebrates in which there is distinction of sex, the name ovary is applied to any part of the body which can be recognized as having the function of ovulation. Such organs are of almost endlessly varied character in all but the essential physiological respect. Several kinds of ovaries receive specific names; and in many cases the analogy to

down, beat down, prostrate. The first three of the Ital-
icized words indicate violence and destructiveness. In-
vert is rarely used where the action is not careful and with
a purpose: as, to invert a goblet to prevent its being filled.
That which is overturned or overthrown is brought down
from a standing or erect position to lie prostrate. Over-
throw indicates more violence or energy than overturn, as
throw is stronger than turn. That which is subverted is
reached to the very bottom and goes to wreck in the turn-
ing: as, to subvert the very foundations of justice. To
invert is primarily to turn upside down, but it may be
used figuratively, of things not material, for turning wrong
side before or reversing: as, to invert the order of a sen-
tence. See *defect*, a. t., and *demolish*.

II. intrans. To be overturned; capsize: as,

An oviduct exists in most vertebrates, and is usually paired, there being one to each ovary, but often single, the duct of one or the other side remaining undeveloped, as in birds. When well formed, as in birds and other animals which lay large eggs to be hatched outside the body, the oviduct is a musculo-membranous tube or canal, of which one end is in relation with or applied to the ovary, and the other debouches in the cloaca, the tube being held in place by a special mesentery or mesometrium. In the course of the oviduct its mucous membrane acquires special characteristics, and secretes different substances; so that the ovum, escaping from the ovary as a ball of yellow yolk, becomes successively coated with white albumen, with a soft egg-pod, and finally, as in birds, with a hard chalky shell. The oviducts of the lowest mammals, which are oviparous, are of similar character; but in most mammals the pair of oviducts coalesce in the greater part of their length, whence result a single vagina and womb, with a pair of Fallopian tubes or oviducts in a restricted sense. A womb or uterus is simply a specialized part of an oviduct, where the ovum is detained long enough to be developed into a fetus and born alive. The oviducts of invertebrates, where any exist, are as diverse in character as the ovaries. See *ovary*, and cuts under *Dendroica*, *Dibranchiata*, *Echino*, and *Gracilis*.

ovipositor (ô-vî-pô-zî-tor), *n.* [(*L. ovum*, egg, + *positor*, builder, founder, < *positus*, pp. of *ponere*, lay; see *posit*).] The ovipositing organ with which many (especially hymenopterous, orthopterous, coleopterous, and dipterous) insects are provided, and by means of which they place their eggs in a position suitable for development. It forms the end of the abdomen, several of the rings or somites of which are specially modified for this purpose. It normally consists of three pairs of rhabdites, the outer two pairs of which form the inner jaws, and form an extensible tube, of

very variable size and shape in different insects. It is sometimes longer than the body of the insect. In the termitid hymenoptera the ovipositor forms a saw or an auger (*sera* or *terebra*). In the aculeate hymenoptera, as bees and wasps, the ovipositor is the sting or scutum. In orthoptera it is often conspicuous, as seen in the cut. Also called *ovipositor*. ovoviviparous (ô'vô-vî-vîp'â-rus), *a.* [(*NL. ovoviviparus*, < *L. ovum*, egg, + *L. viviparus*, bringing forth alive; see *viviparus*.] Producing eggs which are hatched within the body of the parent but without placental attachment, so that the young are born alive, yet have not been developed in that direct connection with the blood-vessels of the mother which is characteristic of viviparous animals. Ovoviviparous animals are intermediate in this respect between oviparous and viviparous ones, whence the name. The process is a kind of internal incubation, but not a true gestation or pregnancy. It occurs in some fishes, many reptiles, some insects, as flesh-flies, various worms, and a great many other invertebrates. The carrying of eggs in any special receptacle about the body, from the time they leave the ovary until they hatch, also constitutes ovoviviparity. The placental mammals, as marsupials, whose young are born very imperfect and then placed in a pouch, are sometimes called ovoviviparous.

In women ovulation normally recurs thirteen times a year during the sexual life of the individual, and is accompanied by the phenomena of menstruation.

ovule (ô'vûl), *n.* [(*F. ovule*, < *ML. ovulum*, a little egg (NL. an ovule), dim. of *L. ovum*, egg; see *ovum*).] 1. A little egg; specifically, in anat., physiol., and zool., an ovulum or ovum, especially a small one, as that of a mammal, or one not yet matured and discharged from the ovary; specifically applied by Haeckel to the ovum or fertilizable but unfertilized egg-cell of the female, conformable with the use of *spermule* for the male sperm-cell. Its protoplasm is formed by him *ovoplasm*, and its nucleus *ovococcus*.—2. In bot., a young or rudimentary seed; a peculiar outgrowth or production of the carpel which, upon fertilization and the formation of an embryo within, becomes the seed. In the angiospermous gynoecium the ovules are normally produced along the margins, or some part of the margins, of the carpillary leaf, either immediately or by the intermediation of a placenta, which is a more or less evident development of the leaf-margins for the support of the ovules. Barely ovules are developed from the whole internal surface of the ovary, or from various parts of it, in no definite order, directly from the wall, and without the intervention of anything which can be regarded as a placenta. In gymnosperms the ovules are borne on the face of the carpillary scale or at its base; or on undifferentiated leaf margins, as in *Cycas*; or, when there is no representative of the carpel, on the outline axis seemingly as a direct growth of it (*Gray*). The only essential part of the ovule is the *nucleus*, or *sacculus*, as it has been termed recently, which is usually invested by one or two coats, the *primine* and *integumentum*. The ovule arises with a narrow orifice called the *stomium*, the distal end of which becomes the *micropyle* in the seed. The proper base of the ovule is the *chalazæ*, and it may be either sessile or on a stalk (*funiculus*) of its own. The *albumen* is the mass left when the seed is detached from its funiculus. As to shape ovules may be orthotropous, campylotropous, amphitropous, or anatropous; and as to position in the ovary, they may be erect, ascending, horizontal, pendulous, or suspended. In regard to numbers, they may be solitary, few, or indefinitely numerous. Rare cuts under *anacardium*, *anacardium*, *funiculus*, *magnolia*, *orthotropous*, and *ovary*.

ovum (o'vūm), n.; pl. *ova* (o'vū). [*L.*, = *Gr. ōvōn*, an egg; see *ovip*.] 1. An egg, in a broad biological sense; the proper product of an ovary; the female germ or seed, which when fertilized by the male sperm, and sometimes without such fecundation, is capable of developing into an individual like the parent. There is a great similarity in the ova of different animals throughout the metazoic series, from the sponge to the human being, no ova in their early stages being distinguishable from one another in their essential characters. All true ova, as distinguished from spores and products of fission or gemmation, are referable to the single morphological type of the cell; and this type is further distinguished by molecular analysis, and from many of the cells composing the bodies of the higher animals. An ovum consists of a quantity of protoplasm or cell substance called the *cytella* or *yolk*, enclosed in a cell-wall or vitelline membrane, and provided with a nucleus and usually a nucleolus; it is engendered in the ovary, usually in an *oviole* or so-called Graafian follicle, disengaged from its matrix, usually then meeting with the male element, and proceeds to develop within or without the body of the parent. The ovum proper, like most cells, is usually of microscopic size; but its bulk may be enormously increased by the addition of extraneous or adventitious protoplasmic or albuminous substance, and it may be further protected by various kinds of egg-pod or egg-shell, all without losing its essential character as a cell. The largest ova, relatively and absolutely, are birds' eggs, those being by far the largest cells known in the animal kingdom. Here the quantity of food-yolk which does not undergo transformation into the body of the chick is out of all proportion to the formative yolk proper, which makes only a speck in the great ball of "yellow" and "white." Such ova are called *macroblastæ*, in distinction from *holoblastæ*. The human ovum is very minute, relatively and absolutely, averaging about $\frac{1}{100}$ of an inch in diameter. It is said to have been first recognized by K. E. von Roon in 1827. The parts of the ovum have been badly named, without reference to its morphology as a cell. Thus, the cell-wall is called the *zona pellucida*; the nucleus is named the *germinal vesicle* or *vesicle of Buringe*, and its nucleolus the *germinal spot* or *spot of Wagner*. The phrases *germinal vesicle* and *germinal spot* are misleading. The first stages of development of an ovum, consequent upon fertilization, consist in the segmentation of the *cytella*, or yolk division, by which the cell-substance becomes a milky mass of spherules, called the *morula*. The rest is an intricate process of differentiation and specialization of these spherules, and their multiplication into the myriads of different kinds of cells of which the whole body of most adult animals is fabricated. Some of the early special stages of this process are known as the *morula*, *gastrula*, *blastula*, etc. The first tissue or coherent layer of cells produced is called a *blastoderm*. When there are two layers, inner and outer blastodermic layers, they are distinguished as *embryonic* and *ectoderm*; when a third intermediate layer is formed, it is the *mesoderm*. An ovum is called, in general, a *germ* until the rudiments of its specific characters appear, when it becomes an *embryo*, and later may be a *fetus*. That department of ontology which treats of the development of the ovum is *embryology*. See

A raporial nocturnal bird of prey of the family *Strigidae*. Owls constitute a highly monomorphic group, the suborder *Strigæ* of the order *Scapiformes*. With few exceptions, they are of distinctly nocturnal habits and a peculiar physiognomy produced by the great size and breadth of the head and the shortened face with large eyes looking forward and usually set in a facial gulf or disk of modified feathers, which hide the base of the bill. Many owls have also "horns" (that is, ear-buffs or plumbeous). The bill is hooked, but never toothed, and the nostrils open at the edge of the cere, not in it. The plumage is very soft and blended, without afterfeathers, and the flight is noiseless. The talons are large, sharp, and hooked as in other birds of prey; the outer toe is very little; and the feet are usually feathered to the claws. (See *cut under* *Strigidae*.) There are many anatomical characters. (See *Strigidae*.) Owls are among the most nearly cosmopolitan of birds. They feed entirely upon animal substances, and capture their prey alive, as small quadrupeds and birds, various reptiles, fishes, and insects. They lay

in the natural state as a bull, whose female is a cow, and whose young is a calf; in a wider sense, an animal of the family *Bovidae* and sub-family *Bovinae* or *Oribovinae*; a bovine. The several animals of this kind have each of these specific designations, as *buffalo, bison, carabao, ox, oxen, etc.*; the word is commonly restricted to the varieties of *Bos taurus*, the common ox, which is one of the most valuable of domestic animals. Its flesh is the principal article of animal food, and there is scarcely any part of the animal that is not useful to mankind: the skin, the horns, the bones, the blood, the hair, and the refuse of all these, have their separate uses. Having been specially domesticated by man from a stock which it is probably impossible to trace, the result has been the formation of very many breeds, races, or permanent varieties, some of which are valued for their flesh and hides, some for the richness and abundance of their milk, while others are in great repute for both beef and milk. Among the first class may be mentioned the Durham or shorthorn, the polled Aberdeen or Angus, and the West Highland or Kyle. Among the most celebrated for dairy purposes are the Jersey, Guernsey, Holstein-Friesian, Ayrshire, and Suffolk down. For the purposes both of the dairy-farmer and of the grazer, the Herford and a cross between a shorthorn and an Ayrshire are much fancied. The ox is used in many parts of the world as a beast of draft. The "wild ox," now surviving in only a few parks, as at Chillingham Park in Northumberland and at Cadzow Forest in Lanarkshire, seems, whatever its origin, to have been formerly an inhabitant of many forest-districts in Great Britain, particularly in the north of England and the south of Scotland.

chem., a compound of oxygen with another element. The oxides are grouped as acid-forming, basic, or neutral. The acid-forming oxides, also called *acid anhydrides*, are compounds of oxygen with negative or acid radicals. Most of them unite directly with water to form acids, as sulphuric acid, SO_3 , which unites with water to form sulphuric acid, H_2SO_4 . The basic oxides are compounds of oxygen with positive elements. Many of them form hydroxides, all of which neutralize acids, forming salts, as barium oxide, BaO , which forms the hydrate $Ba(OH)_2$. The neutral oxides or peroxides usually contain more oxygen than the others, and have only very feeble acid or basic properties. Certain oxides cannot be classed with any of these groups, having both acid and basic properties.

oxygen (ok-si-jen), *n.* [*< F. oxygène* = *Sp. oxígeno* = *It. ossigeno*, *ossigeno*; *< Gr. ôxys*, sharp, acid, + *γεν*, producing; see *-gen*.] **1.** Chemical symbol, *O*; atomic weight, 16. An element discovered by Priestley in 1774, who called it *dephlogisticated air*. It was finally called *oxygen* by Lavoisier, because supposed to be present in all acids. Further investigation, however, has proved that this is not the case. Oxygen is a chemical element existing as a permanent gas, colorless, odorless and tasteless, and somewhat heavier than atmospheric air. It is soluble in water, which at a temperature of 60° F. dissolves 3.4 of its volume of oxygen. Oxygen combines very readily with most of the elements, and forms oxids with all of them excepting fluorin. The act of combination is so energetic in many cases as to evolve light and heat, the phenomena of combustion. In other cases, as in the tarnishing or rusting of metals and the decay of animal or vegetable substances, oxidation takes place as slowly that, while the result is the same, the heat evolved at one time is not enough to produce luminous effects or even to be sensible. Free or uncombined oxygen is essential to all animal and vegetable life. Animal heat and muscular energy are results of a slow combustion produced in all parts of the system by oxygen carried in the blood from the lungs. In sunlight oxygen is exhaled by growing plants, but a certain quantity is assimilated and is essential to life. Oxygen is the most widely distributed and abundant element in nature. It constitutes about one fifth of the total volume of the atmosphere, which is a mechanical mixture of oxygen and nitrogen with small amounts of other substances. Water contains about 89 per cent. of it by weight, and it is found in most animal and vegetable products, acids, oxids, and salts. The rocks which make up most of the earth's crust contain between 40 and 60 per cent. of oxygen. Under certain conditions oxygen may be made to pass into an allotropic or condensed form called *ozon*.

It was Lavoisier who gave to this curious kind of air or gas the name of *Oxygen*, by which it is now universally known; and it was he, too, who first showed, by the most conclusive experiments, what was really the composition of atmospheric air. His determination of the constitution of the air was made in the year 1777.

An edible bivalve mollusk of the family

A Fossil Oyster, *Ostrea longirostris*.

Ostreidae, such as *Ostrea edulis*, the common species of Europe, and *O. virginica*, that of the Atlantic coast of the United States. The species are very numerous, and are found in all temperate and tropical countries, in salt and brackish water; there are also many fossil species. The shell is very irregular, both inequivalve and inequilateral, with one valve flattened and the other more convex-convex, both rough outside and smooth inside. Each valve has one purplish eye or spot, showing where the single adductor muscle is attached, oysters being thus monomyarian. The gritty button-shaped body in the flesh is this filament. The soft greenish substance corresponds to a liver. The fluted layers around a part of the body are the gills or breathing-organs. Oysters have sex, and are very prolific. They spawn in north temperate countries in May and June, during which period and for some time afterward they are not so good for food; whence the common saying that oysters are not eatable in those months which have no *r* in their names. The spawn of *it* is called *spat* or *spat*. Oysters are now very extensively cultivated; the resulting stock being superior to the natural oyster. Starfishes and some carnivorous gastropods (see *burry*) are among the great obstacles to success with which oyster-culture has to contend. Oysters feed upon a great many different aquatic organisms of minute size. In confinement they eat *algæ* and *diatoms*. See cuts under *colpium*, *gastropoda*, and *Ostrea*.

Oysters in Cury, oysters in gummy, your balthie to remove.

The tongue of a Purple (a murex or some such shell) is about the length of a finger, so sharp and hard that he can open therewith the shell of an oyster.
Shedd, Traveller, p. 161.

The oyster-shaped bit of dark meat in the front hollow of the side-bone of a turkey or similar bird.—4. Figuratively, some profit or advantage which one may seize and hold. [Slang.]—A *choking* or *stopping oyster*, a reply that leaves one nothing to say, as if choked with an oyster too large to swallow.

At an other season, to a febe laying to his rebuke that he was over delicate of his mouth and diet, he did with this reason give a *dropping oyster*.
Cadell, tr. of Apophthegms of Erasmus, p. 61.

Herewithall his wife, to make up my mouth,
 Not only her husband's taunting tale avowth,
 But thereby devoteth to cast in my teeth
 Checks and chiding oysters.

Beach oyster, an oyster sold at a lunch-counter as a fancy or extra grade. — **Blue Point oyster**, originally, an oyster obtained off Blue Point, near Great South Bay, Long Island, now, any oyster from the south shore of Long Island, whether native or transplanted. They are commonly called *Blue Points*, and the name is popularly but wrongly supposed to refer to the large dark bluish "eye" on the inside of the shell. These oysters are of small size but very delicate and well-flavored. — **Box oyster**, an oyster from seven to ten years old, of handsome round shape, not less than three inches wide and five inches long. It is the second grade in the New York market, inferior to Saddlecock, and superior to cullings and bushel oysters. The name is due to the fact that they used to be shipped in boxes instead of barrels. (Connecticut and New York.) — **Bushel oysters**, oysters of inferior quality, sold by the bushel. They form the fourth grade in the New York market, rated below Saddlecock box and cullings. — **California oyster**, (*Ostrea lurida*) of the Pacific coast of North America. — **Canadian oyster**, a northern oyster which has been distinguished by the name *Ostrea canadensis*. — **Cape oyster**, an oyster obtained from Cape Cod or vicinity, a kind of northern native or hard oyster. Also called *Capes*. (Boston, Massachusetts.) — **Cat's-tongue oyster**, a very narrow and elongated oyster. The habit of growing in the erect position, where the banks are unsoft and undisturbed, crowds the oysters together, so that under such conditions they do not have a chance to expand laterally. — **Cockscomb oyster**, same as *cockcomb*. — **Cove oyster**, (a) A name of oysters growing singly in or scattered over coves, creeks, bays, old planting grounds, etc., too sparsely to be taken by the ordinary method of tonging, but captured singly in from four to eight feet of water with dipnets. Such oysters are usually large and fat, and are commonly called *cock*. (b) Among packers, steamed oysters packed in hermetically sealed cans, a trade-name. — **Dragon oyster**, a small but delicate oyster, found in New Haven Harbor (named from *Dragon*, nickname of the oystering village of Fair Haven, New Eng.). — **English oyster**, the common European oyster (*Ostrea edulis*). — **Hard oyster**, the native northern oyster of the United States. — **Mangrove oyster**, an oyster growing on the submerged trunks and roots of mangrove-trees, as in Florida. — **Mountain oyster**, a lamb's testicle. — **Northern oyster**, *Ostrea borealis*, growing in northerly parts of the United States, sometimes supposed to be a distinct species from the southern *Ostrea edulis*. — **Raccoon oyster**, an oyster growing in shallow water and daily exposed to the air during ebbs, the whole of which they become small and poor. They have many fanciful local names. — **Reef oyster**, an oyster growing naturally on reefs; a *reefer*. (Alabama to Texas.) — **Saddlecock oyster**, the first or largest grade of oysters in the New York market. The oysters that first bore that name were taken from a rock so called in Little Neck Bay, Long Island, the supply from which was soon exhausted. — **Sand-oysters**, oysters which have been scattered and exposed or damaged on sand shoals; sand oysters. — **Shrewsbury oysters**, oysters from Shrewsbury river, New Jersey. — **Singie oyster**, an oyster which becomes detached from the bunches after two years' growth; hence, a grown or merchantable oyster. — **Soft oyster**, the oyster obtained from the Chesapeake and northward, distinguished from the hard or native northern oyster. — **Thorny oysters**, bivalves of the genus *Spondylus*. — **Tonged oysters**, oysters taken with the tongue; they are preferred to those which are dredged. — **Vegetable oyster**, same as *oyster plant*, 2. — **Wild oyster**, an oyster of natural growth, neither artificially propagated nor transplanted. — **Window oysters**, the *Pectinidae*. See *cat* under *Pecten*. (See also *com-oyster*, *pearl-oyster*, *rock-oyster*.)

ozone (ó-zón), *n.* [= F. *ozone*; < Gr. *ὄζω*, smell, + *-one*.] A modification of oxygen, having increased chemical activity; a colorless gas having a peculiar odor like that of air which contains a trace of chlorine. The density of ozone is one and one half times that of oxygen. It is produced when the electric spark is passed through air or oxygen, when a stick of phosphorus is allowed to oxidize slowly, and in various other ways. At a high temperature ozone is changed into ordinary oxygen, two volumes of the former yielding three volumes of the latter. Chemical tests show that ozone exists in the atmosphere to a minute extent, and in greater quantity in country districts than in towns, while in crowded thoroughfares it ceases to be recognizable. Ozone has a great power of destroying offensive odors, and is a powerful bleacher and an intense oxidizer.

The proportion of ozone in the air stands in a direct relation to the amount of atmospheric electricity present. *Roscoe and Schorlemmer*, Chemistry, I. 200.

ozonometry (ó-zó-nóm'et-ri), *n.* [*E. ozone* + (*Gr.* *μετρον*, measure.)] The art of measuring the relative amount of ozone in the atmosphere.

ozonoscope (ó-zó-nó-skóp), *n.* [*E. ozone* + Gr. *σκοπεω*, view.] A test-paper which is oxidized and discolored by ozone. When properly exposed, the degree of discoloration indicates the relative amount of ozone in the air. Ozone papers are usually either red litmus paper dipped in a dilute solution of potassium iodide, or paper saturated with a mixture of potassium iodide and starch. In the litmus-paper the ozone decomposes the potassium iodide and combines with the potassium, forming potash, by which the red litmus is rendered blue. In the iodized starch-papers, the ozone combines with the potassium, and the free iodine combines with the starch, forming a blue iodide of starch.

ozonoscopic (ó-zó-nó-skóp'ík), *a.* [*Ozonoscope* + *-ic*.] Indicating the presence of ozone.

1. The sixteenth letter and twelfth consonant of the English alphabet, having a corresponding position in other alphabets. The various forms of parallel forms, as given in the case of the other letters (see especially A), is as follows:

ⲑ ⲡ ⲓ ⲓⲣ
Egyptian Hieratic Phoenician Early Greek and Latin

The usual Greek π was made by extending the originally short second perpendicular limb; the Latin (whence our *P*), by curving the same around to meet the perpendicular (see B). *P* in all these alphabets stands for the same unvarying sound, namely, for the semi-labial mute (corresponding to *b* as sonant, and as *p* as nasal) made with closure of the lips, during the maintenance of which closure there is complete silence, its character being brought to light by explosion upon the following sound. The *p*-sound is in English much less common (below a third) than the *t*-sound, and slightly less common (about four fifths) than the *k*-sound. The character *p* has no variations or irregularities of pronunciation in English save as it is silent at the beginning of a few Greek words, as *pneuma*, *pneumatic*, *pteropod*, and, much more rarely, elsewhere, as in *recept*, *recomp*. It enters into one important digraph, namely *ph*, found in numerous words of classical origin, and pronounced as *f* (but originally as written, or as an aspirated *p*, as *p* with an audible *h* after it, as in our compound *ephod*) (see *ph*). According to the general law of correspondence, a *p* in the Germanic part of our language should represent an original *b*; but *b* appears to have been almost altogether wanting in the primitive language of our family, and hence our *p*, when not of classical origin, or borrow'd from elsewhere, is the result of some irregular process.

2. As a medical numeral, 400; with a dash over it (\overline{P}), 400,000. — 3. As a symbol: (a) In chem., the symbol for phosphorus. (b) In math., the Greek capital Π denotes a continued product.

Thus, $\Pi_p (1 + p)$ for which $\Pi (1 + m)$ is also written, denotes the product $(1 + m)(m + 1) \dots 3 \cdot 2 \cdot 1$. The small Greek letter π denotes the ratio of the circumference to the diameter, or $3 \frac{1}{7} \frac{7}{8} \frac{5}{8} \frac{4}{5} \dots$. This notation was introduced by Euler. The other form of the Greek minuscule, π , denotes in astronomy the altitude of the perihelion.

(b) Tubes of lead or other soft metal filled with some vegetable material, such as hemp or cotton. The packing originally used was a leather bag filled with flaxseed, called a *seed bag*, made in the form of a ring. The flaxseed, swelling on being wetted, closed tightly the opening to be stopped. This packing swelled so tightly as to be very difficult to remove—a difficulty which led to the invention of many substitutes. One of these is the modern water packing, which consists of an annular leather packing, concave on the upper surface, surrounding the pipe, and held in position by a screw-joint. The weight of the superincumbent water presses this packing closely against the interior of the bore. Another form of oil well packing, which stops efflux of oil under internal gas pressure, as well as influx of surface water, is shown in the accompanying cut.

The peon has a magnitude of five moræ or primary times (i. e., is pentameter). Its resolved form being the pentabach (— — — —). Three of these times belong to the thesis and two to the arsis, or vice versa (— — — —), so that the peon belongs to and is the type of the hemistich or peonic class of feet. Only the first peon and the fourth peon were in use in *pænic* verse; the contracted form known as the *cretic*, being, however, more common; the second and third occurred in *verses* analyzed by the ancients as mixed ionic, or apollonic. The *cretic* (— — — —) was sometimes known as the *peon diatylus*, as distinguished from the *peon epibacchus* (— — — —), in which each short of the pentabach was doubled (i. e., represented by a long). The peon received its name from its original use in compositions in honor of Apollo (see *pean*). See *diatylus*, *epibacchus*. Also spelled, less correctly, *peon*.

In the first *peon*, an equivalent of the *cretic*, an arsis consisting of a long and short is followed by a thesis consisting of two shorts.

See the quotation from Trench; see also *paganism*.

Meint [I find] in the writings that among the *paganes* the priests that looked chaste like the temple were to hold vain the others that hit no more like chaste.

Agenbite of Inyght (E. T. A.), p. 235.

The Christian Church fixed itself first in the seats and centres of intelligence, in the towns and cities of the Roman Empire, and in them its first triumphs were won; while long after these had accepted the truth, heathen superstitions and idolatries lingered on in the obscure hamlets and villages of the country, so that *pagani* or villagers came to be applied to all the remaining votaries of the old and decaying superstitions, inasmuch as far the greater number of them were of this class. The first document in which the word appears in its secondary sense is an edict of the Emperor Valentinian, of date A. D. 364. The word "heathen" acquired its meaning from exactly the same fact, namely, that at the introduction of Christianity into Germany the wild dwellers on the "heath" longest resisted the truth.

Trench, Study of Words, p. 102.

often applied to two, however accidentally brought to-

hand, applies only to two animals customarily yoked to-
gether: as, a yoke of oxen. Brace is rather a hunters' term,
with limited and peculiar application: as, a brace of par-

common law courts were mostly determined per pais. The
chief if not the only exception was where a question was
made as to a matter depending upon a record, in which

They have a long compressed body, long vertical fin, a long beak (toothless or with very small teeth), the dorsal fin extending the whole length of the back, the anal reaching from the vent to the caudal, the caudal forked, and the ventrals thoracic in position and composed of several rays. The species are all extinct; they lived during the later Cretaceous and early Tertiary, and, as is supposed, in the deep sea.

Palaeornis (pá-lē-ō-rnis), n. [NL., < Gr. *palaios*, ancient, + *ornis*, a bird.] The typical genus of *Palaeornithinae*, founded by Vigors in 1825; so called because some bird of this kind was known to the ancients of Greece and Rome. One species was named by Linnaeus *P. alexandri*, on the supposition that it was that mentioned by Oescripius, a historian of Alexander the Great. These birds are known as *ring-parrots*, from the characteristic collar around the neck. *P. torquatus* is the common ring parrot of India, in parts of which country it abounds, sometimes in flocks of thousands. This appears to be the bird often figured as an attribute or accessory of some of the Hindu goddesses in sculpture and painting, like the owl of Minerva or the dove of Venus. *Palaeornis* is the largest as well as the name giving genus of its group, with upward of 20 species, inhabiting chiefly the Oriental islands, but also Africa. The general color is green, the bill waxy red in the male, the lores feathered, the tail long and emarginate, the wings pointed, and the form rather illu. The voice is very loud and harsh, but the birds may be taught to talk a little, and prove tractable in confinement. See cut under *ring parrot*.

Palaeornithidæ (pá-lē-ō-rnīthī-dē), n. pl. [NL., < *Palaeornis* (-ornith-) + *-idæ*.] The *Palaeornithinae* elevated to the rank of a family. In Garrod's arrangement, the usual scope of the group is extended to include the cockatoos which are generally placed in a separate family *Cacatuidæ*; in this case the family is divided into two subfamilies *Palaeornithinae* and *Cacatuidæ*.

[NL., < *Palaeornis* (-ornith-) + *-inae*.] A subfamily of *Pittacidæ*, typified by the genus *Palaeornis*, found in the Australasian region, India, and Africa, including Madagascar. Allen in 1878 upon remains from the insect-bearing shales of Florissant, Colorado. The species is named *P. bella*. It was little larger than a sparrow. Palamite (pal'ā-mīt), n. [*Palam* (as) (see def.) + *-ite*.] One of the followers of Gregory Palamas, a monk of Mount Athos in the fourteenth century. Nicon, abbot of a monastery at Constantinople in the eleventh century, taught that by fasting, prayer, and contemplation, with concentration of thought on the heart and spirit would be seen within, luminous with a visible light. This light was believed to be uncreated and the same which was seen at Christ's transfiguration, and is known accordingly as the *Uncreated Light of Mount Tabor*. The doctrine was more carefully formulated and defended by Palamas, who taught that there exists a divine light, eternal and uncreated, which is not the substance or essence of deity, but God's activity or operation. The Palamites were favored by the emperor John Cantacuzene, and their doctrine was affirmed by a council at Constantinople in 1351. They were called by their opponents *Euchites* and *Masochites*. Also *Haghiast*, *Uncreatedism*.

as much in height, with wooden shutters made on the principle of the Venetian blind. It used to be a very common conveyance in India, especially among the European residents, but the introduction of railways and the improvement of the roads have caused it to be almost wholly abandoned by Europeans. In Japan the palanquin is called *norimono*, and is suspended from a pole or beam passing over the top. A similar conveyance called a *kinoko* is extensively used in some parts of China; it is, however, furnished with long shafts before and behind instead of the pole, and is carried by mules. palatal (pal'ā-tal), a. and n. [= *F. palatal* = *Sp. Pg. palatal*, *NL. palatalis*, of the palate, *L. palatum*, palate; see *palate*.] I. a. 1. In anat., of or pertaining to the palate; palatine: as, palatal arteries, nerves, muscles; the palatal plate of the maxillary bone. Also *palatal*.—2. Uttered by the aid of the palate, as certain sounds. See II., 2. **Palatal glands**, *index*. Same as *palatine glands*, *index* (which see, under *palatine*).

II. n. 1. A palatine bone or palate-bone proper, one of a pair, right and left, of facial bones entering into the formation of the hard palate. They exhibit the utmost diversity of shape and relative size, but preserve constant position and relation in the bony framework of the upper jaw, where they are interposed between the supramaxillary bones in front and the pterygoid bones behind, and thus form an integral part of the preoral visceral arch. In their simplest form, the palata are mere rods or plates extending horizontally from the pterygoids to the maxillaries. Their connection with the latter is closest, most frequently by fixed suture or ankylosis; with the former it is usually free, often by movable articulation. There are many modifications of these bones in the lower vertebrates, and in the higher the tendency is to shortening, widening, heightening, and complete fixation with some connections not acquired in lower animals. Such modifications reach a climax in man, where the palata have a singular shape somewhat like the letter L, and very extensive articulations with no fewer than five other bones—the sphenoid, ethmoid, supramaxillary, maxillo-turbinal, vomer—and with each other. The bone here consists of a horizontal part, or palatal plate, which extends mesad and meets its fellow of the opposite side, thus forming the back part of the bony palate, and of a vertical plate which reaches into the orbit of the eye by a part called the *orbital process*. Each bone thus enters into the formation of the walls of three cavities, of the mouth, nose, and eye; it also assists to form three fossae, the zygomatic, sphenomaxillary, and pterygoid; it bounds part of the sphenomaxillary fissure, and contributes to closure of the orifice of the antrum of Highmore. The bone furnishes attachment in man to the *musculus uvulae*, the *tensor palati*, the superior constrictor of the pharynx, and both internal and external pterygoid muscles. Notwithstanding its complexity of figure and relations, it is a simple or single bone, developed in membrane from one center of ossification. See cuts under *Anura*, *Craniofacial*, *Crotalus*, *Desmognathus*, *Dromoglyptodon*, *Frida*, *Palatiquadratus*, *Pharyngodon*, *Python*, and *Sphenoid*.

2. A sound usually produced by the upper surface of the tongue against a part of the palate further forward than that at which our *f* and *g* are made; but sometimes used of any sound made between the tongue and any part of the hard or soft palate. Thus, the German *ch* of *ich* is called *palatal*, and that of *sch* guttural; the Sanskrit has palatal sounds distinguished from gutturals: our *t* and *d* and *g* are called palatal, as also the compound *ch* and *j*. The term is a loose one, and requires definition as used by any authority.

palatalization (pal'ā-tā-lī-zā-shon), n. [*palatalize* + *-ation*.] A making palatal; a conversion (especially of gutturals) into palatal sounds, as of *k* into *ch*, *g* into *j*, *s* into *sh*.

The palatalization of the guttural does not recommend the coloring of the vowel. *Amer. Jour. Philol.*, VII. 324.

palate (pal'āt), n. [*ME. palat*, *palet*, *OF. palat*, *palet* (*F. palais*, arising from a confusion between *palais*, palace, and *palet*, *palé*, the vernacular *OF. form*) = *It. palato* (cf. *Sp. Pg. paladar*, *L. as if 'palatere*), *L. palatum*, rarely *palatus*, the palate, the roof of the mouth.] 1. The roof of the mouth and floor of the nose; the parts, collectively considered, which separate the oral from the nasal cavity. Most of the palate has a bony basis, formed of the maxillary bones and

middle of the free edge of this velum, and its sides are continuous with the contracted walls of the passage, called the *pillars* or *arches* of the palate, and constituting the isthmus of the fauces. In osteology the term *palate* is of course restricted to the bony parts. In fishes the palate is that part of the roof of the mouth which corresponds to the palatal bones, behind the vomer and in front of the pharyngeals. See *palatal*, n. 1, and cuts under *Dromoglyptodon*, *mouth*, *nasal*, and *toned*. 2. Taste; relish; from the idea that the palate is the organ of taste.

About 1680 these were separated, the Upper Palatinate and the electoral vote passing to Bavaria, while a new electorate was created later for the Palatinate. In 1777 the two were reunited; in consequence of the treaties of Lunéville (1801) and of Paris (1814-15), Bavaria retained the Upper Palatinate and a portion of the Lower Palatinate west of the Rhine, while the remainder of the Lower Palatinate was divided among Baden, Hesse, Prussia, etc. The Bavarian portions now form the governmental districts of Palatinate and Upper Palatinate.

It was enacted that . . . each palatinate should elect in its districts its own judges. J. Adams, *Works*, IV, 265.

The paleolithic epoch has been subdivided in various ways by different investigators in various regions. In France some have called deposits containing the rudest flint implements *Chellean*, from the locality St. Acheul near Amiens; other deposits with more finished work have been denominated *Mousterian* (from Mouster, on the Vézère); and those with objects of still higher grades of finish have received the name of *Solutrean* (from Solutre, Saône-et-Loire) and *Magdalenian* (from La Madeleine, on the Vézère). The grand divisions of the Paleozoic are, proceeding upward or to groups later in age, the Silurian, Devonian, Carboniferous, and Permian. (See these words.) Of these the Permian is much the least important. The other divisions have been designated respectively as the "age of mollusks," the "age of fishes," and the "age of coal or of land-plants." The Paleozoic series may, from a paleontological point of view, be properly separated into two great divisions, a newer and an older. The former embraces the Silurian, the latter, the Devonian, Carboniferous, and Permian. The older Paleozoic is distinguished by the great predominance of graptolites, trilobites, and brachiopods, and by the absence of vertebrates, the newer Paleozoic, by the number and variety of the fishes and amphibians, by the disappearance of graptolites and trilobites, and by an extraordinarily developed flora, largely cryptogamic in character, from which a very considerable part of the coal of the globe has been formed. Rocks of Paleozoic age are spread over wide areas. They are especially important in the eastern and northeastern United States and in the Upper Mississippi valley, in which regions they usually form the surface rock, being covered only with detrital formations of the most recent age. Almost the whole of the bed-rock in New York and Pennsylvania is of Paleozoic age, and here the various groups of this series were studied out by the Geological Surveys of those States from 1834 on. To the labor of Hedges and Murchison in Wales and western England, carried on at about the same time with the beginnings of the New York and Pennsylvania surveys, is due the larger share of the credit of disentangling the complicated structure of a region where the Paleozoic rocks are extensively developed, and it is there that the materials were obtained for the establishment by Murchison of the Silurian and Devonian systems, which, with the Carboniferous and Permian, form the Paleozoic epoch.

3. Chemical symbol, Pd; atomic weight, 106.5. One of the rare metals associated with platinum. It was separated from native platinum by Wollaston in 1803, and named after the planet *Pallas*, which had just before that time been discovered by Olbers. *Palladium* is dimorphous. It occurs in Brazil native, in minute octahedral crystals; and on the Harz it has been found in small hexagonal plates. It is, however, a decidedly rare substance, and the chief supply comes from the working over of the platinumiferous residues of various mines. It resembles platinum in appearance, but is harder; its specific gravity is 11.4. It fuses more readily than platinum or any other of the so-called platinum metals, melting, as is stated by some authorities, about as easily as wrought-iron. It is both ductile and malleable, and would be a very useful metal if it were not so scarce as to be expensive and irregularly attainable. The graduated surfaces of some astronomical instruments have been made of *palladium*, a use for which this metal is admirably adapted on account of its color and its unalterability in the air. Alloyed with silver, it has been employed by dentists as a substitute for gold.—*Palladium-gold*. See *porphyre*.

On account of its minuteness, and the nebulous appearance by which it is surrounded, no certain conclusion can be arrived at respecting its magnitude. Its diameter has been estimated at 173 miles, and its period of revolution is 4.61 years. Its light undergoes considerable variation, and its motion in its orbit is greatly disturbed by the powerful attraction of Jupiter.

Palliate*, *mitigate*, *excuse*, *glaze over*, *apologize for*. *Palliate* and *extenuate* come at essentially the same idea through different figures. *Palliate* is to cover in part as with a cloak; *extenuate* is to thin away or draw out to fineness. They both refer to the effort to make an offense seem less by bringing forward considerations tending to excuse; they never mean the effort to exonerate or exculpate completely. They have had rather differences of meaning, and *palliate* has a peculiar meaning of its own (see def. 3); *palliate* also would be likely to be used of the more serious offense; but otherwise the words are now essentially the same.

1. In *Rom. antiq.*, a voluminous rectangular mantle for men, corresponding to the Greek *himation* (see *himation*), and considered at Rome, because worn by Greek savants, as the particular dress of philosophers; also, a toga or other outer garment; a curtain, etc., of rectangular shape.—2. *Eccles.* (a) In the early church, a large mantle worn by Christian philosophers, ascetics, and monks. (b) A vestment worn by certain bishops, especially patriarchs and metropolitans. It seems to have come first into use in the Eastern Church, where it is known as the *omophorion*, and to have been worn by patriarchs, and given by them to metropolitans. Some authorities think that it was of primitive origin and at first worn by all bishops, while others hold that it was originally an imperial garment, bestowed by the emperor as a mark of distinction upon patriarchs and others, and afterward given to metropolitans and bishops generally. It has always been of wool, as indicating the pastoral office. It seems at first to have been a mantle rolled together and passed round the neck so as to fall both in front and at the back. It then became contracted in width and was worn nearly as it still is in the Greek Church, as a wide wooden band fastened round the shoulders and descending nearly to the feet. In the Latin or Roman Catholic Church it gradually assumed a different shape, and is now a narrow band like a ring, passing round the shoulders, with two short vertical pieces, falling respectively down the breast and the back. It is ornamented with crosses, and has three golden plaques by which it is attached with loops to the chasuble. The *pallium* was worn anciently in the Western Church by the Pope and by Gallican metropolitans. From the sixth cen-

tury it began to be given by the Pope to some metropolitans outside of his own diocese, in sign of special favor or distinction—at first, according to some authorities, only with approval of the emperor. By the seventh or eighth century it came to be regarded as a sign of acknowledgment of papal supremacy. At present, in the Roman Catholic Church, a bishop elected or translated to a see of metropolitan or higher rank must beg the Pope for the *pallium*, and receives it after taking an oath of allegiance to the Pope. The Pope wears it whenever he officiates, bishops only on certain great feasts. Anglican archbishops no longer wear the *pallium* since the Reformation, but it forms part of the heraldic insignia of the archbishops of Canterbury, Armagh, and Dublin. Also called *pall*.

(c) An altar-cloth; a frontal or pall.—3. In *conch.*, the mantle, mantle-flap, or mantle-skirt of a mollusk, an outgrowth of the dorsal body-wall. It is a specialized, more or less highly and very variously developed integument, including epithelial, vascular, glandular, and muscular structures, and forming folds or processes which represent the foot and other parts. It is often wanting. See cuts under *Lamellibranchiata*, *Pulmonata*, and *Tridacnata*. 4. In *ornith.*, the mantle; the stragulum; the back and folded wings together, in any way distinguished, as by color in a gull, etc.—5. A cirro-stratus cloud when it forms a uniform sheet over the whole sky.

M. Prøy has proposed the name of *Pallium*, but this term has not met with general acceptance.

Scott, Meteorology, p. 126.

A game, formerly played, in which a ball of boxwood was struck with a mallet or club, the object being to drive it through a raised ring of iron at the end of an alley. The player who accomplished this with fewest strokes, or within a number agreed on, was the winner.

To St. James's Park, where I saw the Duke of York playing *pall-mall*, the first time that ever I saw the sport. *Pepys, Diary, April 2, 1661.*

The game might develop into golf or *pall mall*. . . Lathur describes the attitude and 'swing' at *pall mall* in words that apply equally well to golf. . . Generally speaking, the aim was to 'loft' the ball in fewer strokes than your adversary took, through an elevated iron ring.

The flat of the hand; that part of the hand which extends from the wrist to the bases of the thumb and fingers on the side opposite the knuckles; more generally and technically, the palmar surface of the manus of any animal, as the sole of the fore foot of a clawed quadruped, as the cat or

mouse, corresponding to the plants of the pes or foot. In man the palm is fleshy, and presents two special eminences, the *thenar* (ball of the thumb) and, opposite to it, the *hypotenar*, mainly due to the bulk of the subjacent muscles. The habitual tendency of the fingers in grasping and holding throws the skin into numerous creases, several principal ones being quite constant in position. The character of these creases, in all their detail and variation in different individuals, is the chief basis of *chirognomy* or *palimetry*. See phrases under *line*.

palm (pām), *n.* [*< ME. palme*, *< AS. palm* = *OS. palma* = *D. palm* = *MLG. palme* = *OHG. palma*, MHG. *G. palme* = *Lecl. palm* = *Sw. palm* = *Dan. palme* = *F. palme* = *Sp. Pg. It. palma*, *< L. palma*, a palm-tree, palm-branch, the topmost branch, any branch, a palm-branch as a symbol of victory, also the fruit of the palm, a date, also the name of several other plants; so called from the resemblance of the

leaves of the palm-tree to the outspread hand; (*palma*, the palm of the hand: see *palm*). The Gr. name of the date-palm was *phoenix*: see *phoenix*. 1. A tree or shrub of the order *Palmae*. The palms form a natural plant-group of great interest, in appearance highly picturesque and often elegant, and in usefulness surpassed by no family except the grasses. The pulpy fruit of some species, most notably of the date, and the seed-kernel of others, prominently the coconut, are edible. Oil is yielded by the fruit-pulp of some (oil-palm) and by the seeds of others (coconut, baccaba, etc.). The pith of the sago-palm is farinaceous, and the large terminal bud of the cabbage palm serves as a vegetable, as do the young seedlings of the palmyra. The sap of the wild date-tree and other species yields palm-sugar or jaggery; that of the coquina, palm-honey. The juice of various species becomes toddy or palm-wine, which in fermenting serves as yeast, and distilled affords a spirituous liquor. Aside from food and drink, the betel-nut, a kind of catechu, and a kind of dragon's blood are palm-products; a candle-wax exudes from *Ceroxylon*; vegetable ivory is the ivory-palm. Palm-wood is useful for building (date-palm, palmyra, etc.), for fine work (porcupine-wood), for piles (palmetto), and for flexible articles (rattan). The leaves of many species serve for thatching (bass-palm, royal palmetto, palmyra, etc.), for making hats, baskets, and fans, and in place of paper (palmetto, talipot, etc.). The leafstalks of some (kittul, piassava) furnish an important fiber, as also does the husk of the coconut. There are many other uses. The coconut, date, and palmyra-palms lead in importance. The palm of the Bible is the date-palm. (For symbolic use, see def. 2.) As ornamental plants in temperate regions the palms are indispensable where sufficient hot-house room can be had.

2. A branch, properly a leaf, of the palm-tree, anciently borne or worn as a symbol of victory or triumph; hence, superiority; victory; triumph; honor; prize. The palm was adopted as an emblem of victory, it is said, because the tree is so elastic as, when pressed, to rise and recover its correct position. The Jews carried palm-branches on festival occasions, and the Roman Catholic and Greek churches have preserved this usage in celebrating the entry of Christ into Jerusalem. See *Palm Sunday*. See also def. 3.

Among plants so designated are: In Great Britain, chiefly the great willow or goat-willow, *Salix caprea*, at the time when its catkins are out, and the common *oak* (the latter is universally so called in Ireland); in Europe also the olive, holly, box, and another willow, and in the northern United States the hemlock-spruce.

Palme (pal'mē), *n.* pl. [*NL.* (Linnaeus, 1737), pl. of *L. palma*, a palm.] The palm family, an order of monocotyledonous plants of the series *Calycina*, characterized by the one- to three-celled free ovary, solitary ovules, and small embryo immersed in a little hollow near the outside of the hard or oily albumen. About 1,100 species are known, classed in 120 genera, 7 tribes, and 18 subtribes. They are mainly tropical, especially American, and are most abundant on coasts and islands. Fewer in Asia and Australia, fewest in Africa, reaching lat. 44° N. in Europe, 50° in America, 36° in Asia. The species are usually local, excepting the coconut and four or five others. They are trees or shrubs, mostly unbranched, generally perennial, and continued only by a terminal and sometimes edible bud. Their large leaves are pinately or radiately parallel veined, undivided and pinnate in the bud, divided slightly or completely on expansion. The flowers are small, regular, often night or fleshy, often dioecious, usually with six stamens, borne on a branching spathe, with several or many sheathing bract-like or woody spathe. The fruit is a berry or drupe or dry fruit, the outside commonly fibrous, within membranous, crustaceous, woody, or stony. Palmella (pal-mel'á), *n.* [**NL.** (Lyngbye, 1819), a dim. form, having reference to the jelly-like appearance; < *Gr. παλμός*, vibration, < *παλλειν*, shake, vibrate.] A genus of fresh-water algae, typical of the *Palmellales*, having globose or oblong cells, with chlorophyll usually green, but sometimes changing to orange or reddish color. The cells are surrounded by a thick integument, which is generally soon confluent into a shapeless mass of jelly; multiplication is usually by division. The forms included in this genus are probably not autonomous, but represent arrested polymorphic forms which multiply rapidly by the process of cell multiplication, without developing, for a protracted period, the true plant. The particular plants, however, to which they belong have never been determined. — **Palmella stage**, or **palmella condition**, a general phrase sometimes applied to certain of the lower algae which exhibit the peculiar gelatinous masses described above. In the *Scenedesmus* this condition or stage has lately been called the *scenedesmus stage*. See *Zoophora*.

A pilgrim who had returned from the Holy Land, had fulfilled his vow, and had brought with him a palm-branch to be deposited on the altar of his parish church; hence, an itinerant monk who went from shrine to shrine, under a perpetual vow of poverty and celibacy. The distinction between *pilgrim* and *palmer* seems never to have been closely observed.

palmerin (pal'mér-in), *n.* [**Palmerin** (see *def.*).] One of a line of romantic heroes of the age of chivalry, who took their names or their titles from *Palmerin de Oliva*, an illegitimate grandson of a Greek emperor of Constantinople. This *Palmerin* derived his name from the circumstance of his exposure in a wicker basket on a mountain-side among palms and olive-trees in Spain. He afterward became famous for his exploits in Germany, England, and the Orient. The exploits of the *Palmerin*, as celebrated in the famous Spanish romances called by their name, are evidently modeled after those of *Amadis* of Gaul. In literature the name is often applied as a term of distinction to any redoubtable champion of the age of chivalry.

That brave *Roelker*
That damned brood of ugly giants slew,
And *Palmerin* *Frannacker* overthrew.
Beau. and Fl., Knight of Burning Pestle, III, 2.

The oldest ballads tell us nothing at all . . . of the *Palmerin*, nor of many other well-known and famous heroes of the shadow-land of chivalry.

Ticknor, Span. Lit., l. 118.

palmer-worm (pá'mér-wérn), *n.* [**palmer** + *-worm*.] 1. A caterpillar; especially, a hairy caterpillar injurious to vegetation, but what kind is unknown or undetermined. The name occurs three times in the Bible (*Joel* i. 4; ii. 25; *Amos* iv. 9) as the translation of the Hebrew *gizim*, rendered in the Septuagint *σκαρα* and in the Vulgate *crucis*. Some have supposed it to be a destructive kind of locust, as *Pachyschelus gratorius*; but in *Joel* the name is expressly distinguished from "locust." The Hebrew name is referred to a root meaning "to cut off"; the Greek *σκαρα* refers to the bending or looping of some caterpillars, apparently pointing to a looper or measuring-worm — that is, the larva of some geometrid moth; and the Latin *crucis* may have the same significance. The destructiveness of many of these geometrids would fully bear out the Biblical implication. See *cut*.

There is another sort of these Caterpillars, who have no certain place of abode, nor yet cannot tell where to find their food, but, like unto superstitious Pilgrims, do wander and stray hither and thither. (and like *Mice*) consume and eat up that which is none of their own; and these have purchased a very apt name amongst us Englishmen, to be called *Palmer-worms*, by reason of their wandering and rough life (for they never stay in one place, but are ever wandering), although by reason of their roughness and ruggedness some call them *Roarer-worms*. They can by no means endure to be dyed, and to feed upon some certain herbs and flowers, but boldly and disorderly creep over all, and eat of all plants and trees indifferently, and live as they list.

In so far as it is basal, it represents the carpus of the maxilla; in so far as it bears a palpus, it represents the maxillary stylop, or palpifer. The suture between the mentum and its attached palpiger is often obsolete. The name was first applied by Newman to a section of the part called *galea* by Kirby and *labium* by McLeay and others. palpus (pal'pūs), n.; pl. *palpi* (-pi). [*NL.*: see *palp*.] In *zool.*: (a) One of the jointed organs attached to the labium and maxillae of insects; a feeler. The labial palpi are two in number, rising either from the ligula or from the edge of the mentum; the maxillary palpi are placed one on the outer side of each maxilla. Besides these, certain *Coleoptera* have a second two-jointed palpaliform appendage on each maxilla, formed by a modification of the palen or external lobe. The palpi vary much in form and in the number of joints, which is never more than six; they are sometimes aborted or entirely absent, as in the *Hemiptera*. In the *Lepidoptera* this organ is commonly restricted to the large labial palpi, the much smaller maxillary ones being distinguished as *palpi*. The palpi are supposed by some to be organs of taste or touch. In the apidets the maxillary palpi are greatly developed, forming the pedipalpi; these, in the scorpion, become chelate appendages, commonly called the front legs. Small palpi are also developed from the mandibles and maxillae of certain crustaceans. pangenesis (pan-jen'e-sis), *n.* [NL., *< Gr. πᾶν (pán-), all, + γένεσις (genesis), production*.] A provisional hypothesis advanced by Darwin to explain the phenomena of reproduction in organisms.

It rests on the assumptions that the organic units (cells) of which an organism is composed differ from one another according to the function of the organs to which they belong; that they undergo multiplication by budding or proliferation, giving rise to minute gemmules, which are diffused to a greater or less extent throughout every part of each organism; that these gemmules possess the properties which the unit had when they were thrown off; and that when they are exposed to certain conditions they give rise to the same kind of cells from which they were derived. The name is also applied to the theory or doctrine that every organism has its origin in a simple cell called a *pangenetic cell*.

I venture to advance the hypothesis of *Pangenesis*, which implies that every separate part of the whole organism reproduces itself, so that ovaes, spermatocytes, and pollen-grains — the fertilized egg or seed, as well as seeds — include and descend of a multitude of germ-cells, off from each separate part or unit.

It consists of four perforated limbs or rules, *a, b, c, d*, of wood or metal, arranged in pairs, joined together at the crossing, the two pairs being also

Pantograph.

a, b, c, d are rules perforated with a series of holes placed at graduated distances for adjustment to different scales for enlargement or reduction of the picture to be transmitted. *a* and *b* are permanently but movably joined at *a* to a traversing support, *d* and *c* are similarly joined at *d* to a second holder or pivot holder. *b* and *c* are thus in a position to pivot on *a* and *d* and *c* and *b*. The rule *a* is pivoted to a support at which it is fixed to the drawing table. *c* is a stylus, held in the end of the rule *d*. The rule *b* is pivoted to *a* at a larger or smaller scale corresponding to the adjustment.

joined together at *a* and *d*. The perforations are made at uniform distances, in accordance with a scale of measurement. The pivoted points by which the two pairs are connected are constant, while the joints between the intersecting limbs of each pair may be shifted by inserting the joint pins in different holes in each limb. By changing the pins the copy may be reproduced on any scale either larger or smaller than the original, or it may be kept of the same size, the proportion being indicated for convenience by figures on the limbs (not shown in the cuts). In use, the end pivot *a* is fixed to the table, the pivot *d* sliding on the plane surface according to the impulse given to it. The pivot *c* carries a tracing point which is passed over the original lines to be reproduced, and the pivot *b* carries a pencil or needle which traces the copy or prints it in the paper. The pantograph is used for transferring patterns to calico-printing cylinders, in some processes of wood carving, in making wooden type, etc. **Polar pantograph**, a modification of the pantograph arranged for reproducing profiles of curved figures, as the tread of a car wheel, the interior of a bell, or any other irregular form. It consists essentially of two arms supported in a light frame and united by means of a crank on each and a pinion common to both, so that the movement of one arm controls that of the other. When the point of the instrument is placed against the tread of a car wheel, and is moved over it, the other arm reproduces a tracing that is an exact copy of the tread, showing such flattened places as may have resulted from wear, and such other irregularities as are present.

Papilio (pá-pí-lí-ó), *n.* [NL. (Linnaeus), < *L. papilion*, *a.* butterfly; whence ult. *F. papillon*, *a.* butterfly; see *papillote*.] 1. [*i. e.*] A general name of all lepidoptera before the introduction of the binomial nomenclature in zoology. — 2. A notable genus of butterflies; a name variously used. (a) By Linnaeus (1760) for all butterflies then known, equivalent to *Rhopala*. (b) By Fabricius (1793) for butterflies of

pen swallowtail, *P. machon*, as the type species of the genus; Hübner (1817) decides that *P. machon* is the type. By most entomologists the name is now restricted to swallow-tailed butterflies having ample wings, triangular fore wings, hind wings concave next to the body and usually extended behind into a tail before the anal angle, and outer margin of hind wings dentate, with the teeth quite prominent near the tail. The genus thus defined is of world-wide distribution, with about 300 species. The common yellow and black butterfly of North America, *P. comma*, is a good example. Another is the common swallow-tailed butterfly of Europe, *P. machon*, with long antennae, very short palpi, and the hind wings tailed. This species expands about three and one half inches, is yellow and black, with a red spot at the anal angle. Some of the papilioes are giants, as *P. antiochensis* of Africa, expanding about eight inches. See *Rhopala*, 2, and also cut under *P. phobias*.

The larvae are smooth or only moderately yellow, never spinose (thicker in front, tapering behind, with two retractile tentacles on the segment behind the head. The chrysalis are naked, angular, fastened to a button of silk and hung by a silken loop a little above the middle of the body. They are few and small in many parts of the body endowed with comparatively little sensibility, but in some places, especially the palmar and plantar surfaces of the hands and feet, and about the nipple of the breast, they are very large and numerous, and set in special curved lines, thus throwing up the cuticle into the many little ridges observable at the tips of the fingers, for example. The paper-reed or
-rush, *Cyperus Papyrus*
(*Papyrus antiquorum*),
abundant on marshy
river-banks in Alys-
sinia, Palestine, and
Sicily, now almost ex-
tinct in Egypt. It af-
forded to the ancient
Egyptians, and through
them to the Greeks and
Romans, a convenient and
inexpensive writing-mat-
erial. The papyrus was pre-
pared by cutting the cen-
tral pith of the reed into
longitudinal strips, which
were laid side by side, with
another layer of strips
crossing them at right an-
gles. The two layers, thus
prepared, were soaked in
water, then pressed to-
gether to make them adhere,
and dried. For books the
papyrus was formed into rolls by cementing together a
number of sheets. Also called *lily*.

par (pár), *v. t.* [*M.E. parren, inchoate; cf. spar-
Cl. also parrock, park.*] To inchoate.

But strictly parred.

Parren and *Garden* (ed. Elton), I. 222.
But also say so are parred in, and as far as may
pass: therefore so magnify your manner of lyfynge,
and suppose that so are blessed because that so or so
spared in. *M.S. Lincoln A. 1. 17, f. 37. (Hollnhead.)*

par (pár), *a.* [*< par, v.*] An enclosed place
for domestic animals. *Furby. [Prov. Eng.]*

par (pár), *a.* and *a.* [= *F. pair* (> *E. pair*)] =
Sp. Pg. par = *It. pare, pari*, equal. < *L. par*,
equal; as a noun, *par*, *n.*, an equal, a com-
panion, *par, n.*, a pair. Hence ult. (from *L.*
par) *E. pair, peer, parity, disparity*, etc., *um-
pire*, etc.] *L. n. 1.* Equality in value or in
circumstances.

2. The norm; a standard, fixed either by natu-
ral conditions or by consent and agreement.

Its (the barometer's) average height being 29.96 inches
at the mean sea level in England on the London parallel
of latitude: which height may be called *par* for that level.
Pile Roy, Weather Book, p. 16.

Specifically—3. In banking and com., the statu-
of the shares of any business, undertaking, loan,
etc., when they are neither at a discount nor at
a premium—that is, when they may be pur-
chased at the original price (called *issue par*),
or at their face-value (called *nominal par*). Such
shares or bonds are said to be *at par*. When they may be
purchased for less than the issue or nominal par, they are
said to be *below par*, or at a discount; when the price is
greater than the issue or nominal par, they are said to be
above par, or at a premium.

4. Name as *arbitrated par*. See the quotation.

The *par* is a certain number of pieces of the coin of one
country, containing in them an equal quantity of silver to
that in another number of pieces of the coin of another
country: e. g. supposing 20 shillings of Holland to have
just as much silver in them as 20 English shillings.

Locke, Further Considerations on Money.

Above par, at a premium. **Arbitrated par**, **arbitrated
par of exchange**, the amount in the currency of one
country which is equivalent at any time to a given amount
of a foreign currency. The arbitrated *par* represents the
mint *par* as modified by the transient influence of supply
and demand and other circumstances of the time and of
the particular transaction. **Below par**, at a discount.

Issue par, the price at which a stock or other value is
issued to the public, sometimes less than the nominal *par*.
Thus, if bonds nominally for \$100 each are issued at \$90, the
latter is called the *issue par*. **Mint par**, mint *par* of
exchange, the weight of pure gold or silver in a coin of
one country as compared with that in a coin of the same
metal of another country.—**Nominal par**, the face value
of a share of stock, etc. **Par of exchange**, the estab-
lished value of the coin or standard value of one coun-
try expressed in the coin or standard value of another. In
stating this *par* of exchange the standard of value of one
country may be regarded as fixed, and that of the other
variable. Thus, in exchange between the United States and
Great Britain, the United States gold dollar may be taken
as equal to so many shillings and pence sterling, or, as is
more usual, the pound sterling is fixed, and equal to so
many dollars and cents United States gold, viz. \$4.84.

II. *n.* Normal; standard.

The barometer had risen considerably in general, but not
to its normal or *par* height.

Pile Roy, Weather Book, p. 523.

or more countries as to the value of the coins

When two countries *par* their gold coins.
Encyc. Brit., VIII. 720.

par (pár), *n.* [*< L. par, a pair: see par².*] A

in the neck, chest and belly, far beyond that of any other
cranial nerve. See *vagus*.

French, as *parboil, pardon*, etc. See *per*.

ræthesis*.

para (pa-rá), *n.* (Turk., < Pers. *pāra*, a piece,
portion, bribe.) 1. A coin of the Turkish do-
minions, struck in silver and in copper, and
current from the end of the seventeenth cen-
tury. The modern *para* is of copper, and is the fortieth

part of the piaster, the latter being worth about 4.4 United
States cents.

I willingly parted with a few *paras* for the purpose of
establishing an intercourse with fellow-creatures so fear-
fully and wonderfully resembling the fallen babes.

R. P. Burton, El-Medinalah, p. 260.

2 (pá-rá). In the East Indies, a measure of
capacity (at Bombay 3½ bushels); also, a mea-
sure of weight (at Ceylon from 80 to 60 pounds,

para-. [*F. Sp. Pg. It. L. para-*, < *Gr. pára-*,
prefix, *para*, prep., at the side, beside; with
gen., from the side of, from beside, from; with
dat., at the side of, beside, alongside, by; with
acc., prop. to the side of, hence by the side of,
beside, near, by, etc.: as a prefix in the same
senses; cf. *Skt. para*, away, *param*, beyond; *L.*
per, through, *Ocean perum*, without; *AS. and E.*
for, fore, etc.: see *for, fore, per*, etc.] A
prefix of Greek origin, meaning 'from beside,'
'beside,' 'near,' 'by,' etc. See etymology. It
often denotes correspondence of parts. It is used in the
formation of new scientific terms, but is not regarded as
an established formative in English. In chemistry the pre-
fix signifies close relation, as in *parabioside*, a polymer of
aldehyde, or that a compound is formed from benzene by
substituting other elements or radicals for two hydrogen
atoms in the benzene ring, and that these atoms have an
opposite position in the ring. (See *ortho* and *meta*.) In
biology it indicates comparison with something else, yet
a distinctness or difference therefrom in one of many or
various ways. In pathology it signifies a condition differing
in quality from normal.

ra, beside, & L. pártis, baptism; see baptism.*] In the
early church, uncanonical baptism; un-
authorized baptism in private or in a conven-
ticle, as opposed to public baptism in a church
or diocesan baptistery.

next to a basal and articulated therewith.

II. *n.* One of the parabasalæ of a crinoid; a
parabasalæ.

parabasalæ (par-a-bá-sál-ē), *n.*; pl. *paraba-
salæ* (-lī-ē). [*NL., < Gr. pára, beside, & NL.*
basalis, q. v.] One of the joints of a series of
divisions of the branches composing the calyx
of some crinoids, articulating with the basalæ.

Cryptocrinus, the simplest form of the group (of *Cysto-
des*), possesses a calyx supported on a stem and composed
of five basalæ, five parabasalæ, and five radialæ.

Huxley, Anat. Invert., p. 308.

parabasis (pa-rab'-sī-sis), *n.* [*NL., < Gr. pára-*
basís (as def.), < *para*, beside, & *basís*, a step-
ping, step, < *baivō*, walk, step.] The chief
of the choral parts in ancient Greek comedy.
It was sung by the chorus, usually divided into four rows
of six and moving backward and forward facing the audi-
ence during an intermission in the action, and while the
actors were off the stage. It was written for the most
part in anapestic tetrameters, and consisted, in fact, of an
address from the poet to the public, giving his views and
advice on affairs of state, as well as, often, his personal in-
terests and claims for recognition or reward. The *para-*
basis was regularly divided into six rhetorical parts, which
were again subdivided, but any of these parts might be
omitted or modified. It continued in the fully developed
comedy the tradition of the *Bacchic* processions in which
Greek comedy had its origin.

Something similar in purpose to the *parabasis* was en-
acted in one, at least, of the comedies of Menander and
Plautus, and in our time by Truett.

Lowell, Muddy Windows, p. 218.

The distinctive feature of Old, as compared with Middle
Comedy, is the *parabasis*, the speech in which the chorus,
moving towards and facing the audience, addressed it in
the name of the poet, often abandoning all reference to
the action of the play.

Encyc. Brit., VII. 607.

parabema (par-a-bē-mā), *n.*; pl. *parabemata*
(-mā-tā). [*< Gr. pára, beside, & Gr. pára,*
beside, & *bema*, being: see *bema*.] In Byzantine church
arch., either the chapel of the prothesis or the
diakonicon, or sacristy, when these are archi-
tecturally divided, by walls, from the bema or
sanctuary. *J. M. Neale. See pastophorion*, and

bema (-bē-mā) + *-ic*.] In Byzantine church arch., of
or relating to the parabemata; said specifically
of a dome which, instead of resting on four dis-
tinct piers, as in the typical form, is sup-
ported on the east side on the extremities of the
walls of the parabemata, and on the west side
either on piers or on the extremities of the walls
of the antiparabemata when these are present.
J. M. Neale.

parablast (par'-a-blast), *n.* [*< Gr. παρά, beside, + blastos, germ.*] 1. The supplementary or nutritive yolk of a meroblastic egg or metovum, as distinguished from the archblast, or formative yolk. *Wilhelm Hiss*.—2. Same as *mesoblast*. *Microscop. Sci.*, XXIX, 195.

Sections of the eggs of *Trachinus vipera* at this stage show that the parablast of Klein, the intermediate layer of American authors, is made up of a large number of free cells, and nuclei are absorbed from the yolk, which contribute to a very great extent to build up the hypoblast. *Science* IV, 341.

parablastic (par-a-blast'ik), *a.* [*< parablast + -ic*.] Of or pertaining to the parablast; derived from the parablast.

parable (par'-a-bl), *n.* [*< ME. parable, parabole, < OF. parabole, parabola, F. parabole = Sp. parabola = Pg. It. parabola, < L. parabola, parabolē, a comparison, L.L. parabola, scell., an allegorical relation, a parable, proverb, taunting speech, any speech, M.L. also a word, < Gr. παραβολή, a comparison, < παραβάλλειν, < παρά, beside, + βάλλειν, throw. Hence also (from L. parabola) E. parable, parol, parley, palaver, etc. Cf. parabola¹.*] 1. A comparison; similitude.

Been there none other resemblances
That ye may like your parables unto
But if a wily wyl be com of this?
Chaucer, Wife of Bath's Tale, l. 369.

Specifically—2. An allegorical relation or representation from which a moral is drawn for instruction; an apologue. It is a species of fable, and differs from the apologue in that it deals with events which, though fictitious, might reasonably have happened in nature. The word is also employed in the English Bible to signify a proverb, a proverbial or notable saying, a thing darkly or figuratively expressed.

I will open my mouth in a parable; I will utter dark sayings of old. *Ps. lxxviii*, 2.

Shall not all these take up a parable against him, and a taunting proverb against him? *Hab. ii*, 6.

Thou shalt never get such a secret from me but by a parable. *Shak., T. of V.*, II, 5, 41.

Syn. Metaphor, Comparison, etc. (see simile); Fable, etc. (see myth).

parable¹ (par'-a-bl), *v. t.*; *pret.* and *pp. parabled, ppr. parabling.* [*< parable¹, n.*] To represent by a parable or allegorical representation.

That was chiefly meant which by the ancient sages was thus parabled. *Milton, Divorce*, l. 6.

parable² (par'-a-bl), *a.* [*< L. parabola, easily procured, < parare, prepare; see parol¹.*] Capable of being procured, prepared, or provided.

What course shall he take, being now capable and ready? The most parable and easy, and about which many are employed, is to teach a school.

Burton, Anat. of Mel., p. 100.

parabola¹ (pa-rab'-o-lā), *n.* Same as *parabole*.

Whosoever by your similitude ye will come to teach any morality or good lesson by speech misall and dark, or false fete, under a wince metaphorical applying one natural thing to another, or one case to another, inforcing by them a like consequence in other cases, the strokes call it Parabola. *Puttenham, Arte of Eng. Poetrie*, p. 206.

parabola² (pa-rab'-o-lā), *n.* [= *F. parabole* = *Sp. parabola* = *Pg. It. parabola*, < *NL. parabola*, a parabola, < *Gr. παραβολή, a parabola* (see def.), so called by Apollonius of Perga, lit. 'superposition,' < *παρά, beside, + βάλλειν, throw beside, compare; see parol¹.*] 1. A curve commonly defined as the intersection of a cone with a plane parallel with its side. The name is derived from the following property. Let the figure represent the cone. Let *ABD* be the triangle through the axis of the cone. Let *DE* be a line perpendicular to this triangle, cutting *BD* in *H*. Let the cone be cut by a plane through *DE* parallel to *AD*, so that the intersection with the cone will be the curve called the parabola. Let *Z* be the point where this curve cuts *AB*. Then the line *ZH* is called by Apollonius the diameter of the parabola, or the principal diameter, or the diameter from generation; it is now called the axis. From *Z* draw *ZT* at right angles to *ZH* and in the plane of *ZH* and *AD*, of such a length as to make *ZT* : *ZA* :: *HQ* : *AB*. This line *ZT* is called the latus rectum; it is now also called the parameter. Now take any point whatever, as *K*, on the curve. From *K* draw *KL* parallel to *DE*, meeting the diameter in *L*. *ZL* is called the abscissa. If now, on *ZL*, as a base, we erect a rectangle equal in area to the square on *KL*, the other side of this rectangle may be precisely superposed

Parabola, as derived from cone.

upon the latus rectum. *ZT*. This property constitutes the best practical definition of the parabola. If a similar construction were made in the case of the ellipse, the side of the rectangle would fall short of the latus rectum; in the case of the hyperbola, it would surpass it. The modern scientific definition of the parabola is that it is that plane curve of the second order which is tangent to the line at infinity. The parabola is also frequently defined as the curve which is everywhere equally distant from a fixed point called its focus, and from a fixed line called its directrix. The normal to a parabola at every point on the curve bisects the angle between the line parallel to the axis and the line to the focus. See also *cuta under conic*.

Common Parabola, with focus F and directrix AB.

The term is generally used in the plural, referring either to the right and left *parapodia* of any one segment or to the series of successive *parapodia*. The processes are so called because they are lateral in position, projecting from the sides of the worm. Parasite (par'a-si'ti), n. pl. (NL., neut. pl. < L. *parasitus*, m., a parasite; see *parasite*.) In *zool.*, parasites; parasitic animals; applied to several different groups whose members are characterized by their parasitism. (a) In *Crustacea*, low parasitic forms as the siphonophorous and related crustaceans, often collectively called also *Eupoda*, and made a class or order of that name. Most of them are known as *fish-lice*. (b) In *entom.*, lice. In Latreille's system, a group of apterous insects, the third order of insects corresponding to the *Aptera* of Leach. Also *Parasitica*.

parasite (par'a-si'ti), n. [*parasite* + *-i*.] *Sp. parasitica* = *Pg. parasitica* = *L. parasitica* = *G. Sw. Dan. parasit*, < L. *parasitus*, m., parasite, f., < Gr. *parasitos*, one who eats at another's table, a guest, esp., in a bad sense, a parasite, cf. *parasitism*, eat with another, live at another's table, < *para*, beside, + *sis*, food.] 1. Originally, one who frequents the tables of the rich and earns his welcome by flattery; hence, a hanger-on; a fawning flatterer; a sycophant.

I will despair, and be at enmity
With evening hope, he is a flatterer.
A parasite. *Shak*, *Rich. II.*, II. 2. 70.

Outstrip thus by a parasite 'a slave,
Would run on errands, and make legs for crumbs.
B. Jonson, *Volpone*, v. 4.

Specifically—2. (a) In *zool.*, an animal that lives in or on and at the expense of another animal called technically the *host*; also, by extension, an animal which lives on or with, but not at the expense of, its host: in the latter sense, more precisely designated *inquiline* or *commensal* (see these words). There is scarcely any animal that may not or does not serve as the host of parasites, and some parasites are themselves the hosts of other parasites. (See *hyperparasitism*.) Parasites form a heterogeneous group of animals, diverse representatives of almost any class or order, from protozoans to vertebrates, may be parasitic. Most of the leading divisions of animals, however, include some members, whether genera, families, orders, or even classes, whose habit is exclusively or exclusively parasitic. Thus, among protozoans, the *Opisthokonta* are parasitic. Among worms, many families, some orders, or even classes, are entirely parasitic, furnishing the most formidable and fre-

quent parasites of man and domestic animals. Very many of the lower crustaceans are parasites, especially upon fishes, mollusks, etc., and upon one another; while some of the higher crustaceans are modified parasites, or commensals, as the little crabs that live in *echinocysts*. Among arachnids, the whole class or order of *acarids* or mites is essentially parasitic, though including many forms which lead an independent life. Insects furnish many of the parasites, especially of terrestrial animals, as vertebrates, and some are parasites of other insects, the order of insects, the *Aspidoptera* or lice, is thoroughly parasitic, and other orders furnish parasitic families or genera. Insects and crustaceans both belong to the phylum *Arthropoda*, and it may be said that as a rule insects furnish the arthropod parasites of land-animals, and crustaceans those of water-animals, or terrestrial and aquatic "lice" respectively. Few mollusks are parasites, but *Amphicercaria*, a gastropod found in holothurians, is an example. Very few vertebrates are parasites, but *Ascaris* bore into fishes, fishes of the genus *Platypharodon* crawl into the intestines of holothurians, and some other fishes exhibit a kind of parasitism. Parasites not constituting any natural division of animals it follows that as such, they are not naturally divisible into zoological groups. They are, however, conveniently called *ectoparasites* or *ectoparasites*, according as they live in or on their hosts, or *endoparasites* and *endoparasites*, upon the same grounds. According to the extent or degree of their parasitism, they are also known as *parasites proper* and *commensals* or *inquilines* (see above). Among the most remarkable parasites are the males of some species which have their own females as hosts, as among *Chironomidae*. Such males are known as *complemental* males, one or more of which are carried about by the female in her vulva, they being of insignificant size and to the contents and purposes more male parts of her. The above mentioned parasites are exclusive of all those many animals which are parasitic upon plants, as gall-insects and the like; and also of those birds which are parasitic to the extent of laying their eggs in other birds' nests, requiring the tendency to be hatched and brought up by foster parents, as cuckoos and cowbirds. See *cutis* under *Cecropia*, *Malacoptera*, *Episoma*, *Platypharodon*, and *Stilpnus*. (b) Particularly, an insect which lives either upon or within another insect during its earlier stages, eating and usually destroying its host. Such parasites belong mainly to the *Hymenoptera* and to the *Diptera*, but there are a few coleopterans and lepidopterans to which the name may be applied. See *cutis* under *Antigona*. (c) In *bot.*, a plant which grows upon another plant or upon an animal, and feeds upon its juices. See *parasitism*, and *cutis* under *Cecropia*.

Fungi have long been divided into two main sections founded on their nutritive adaptation. Those which constitute the first category feed on living organisms, whether plants or animals, and are termed *parasites*.

De Bary, *Fungi* (trans.), p. 266.

3. In *bot.*, See *autotrophic*. Autotrophic parasite, in *bot.*, an organism which goes through the whole course of its development on a single host.

Metazoan parasite, in *bot.*, same as *metazoan parasite*. Obligate parasite, in *bot.*, an organism to which a parasitic life is indispensable for the full attainment of its development. - *Syn. 1. Parasite*, *Synonym*. The object of the *synonym* is to ingratiate himself with one who is wealthy or powerful, and his means are especially servility and flattery. The parasite gets a maintenance or a more comfortable maintenance by living upon one who is richer; there is no suggestion as to the means employed, but the word is contemptuous as implying a relation of degradation. The derivational idea of *synonym* is now quite lost. The secondary use of *parasite* in connection with plant and animal life now affects the original sense of the relation of human beings.

parasitic (par'a-si'tik), a. [= *F. parasiticus* = *Sp. parasitica* = *L. parasitica*, < L. *parasitica*, < Gr. *parasitos*, parasite, < *para*, beside, + *sis*, food, equipment.] 1. H. Spencer, *Social Statics*, p. 491.

3. In *phyl.*, attached to a word erroneously or by false analogy; thus, *d* in vulgar *drowned*, *t* in *margent*, etc., are *parasitic*. Parasitic has, in *entom.*, one of several genera of true bugs which are parasites orinquilines in the nests of other bees. Thus, members of the genus *Episoma* of which *E. murex* is an example live in the nests of *Colletes*, of *Colletes*, in the cells of *Meagrellidae*, of *Meagrellidae*, in the cells of *Andrena*, and of *Andrena*, with *Andrena*. - Parasitic birds, those birds which lay their eggs in the nests of other birds, as the Old World cuckoos and the New World cuckoos. - Parasitic currents. Same as *Foucault currents*.

account of some fault or offense.

I never denied justice to a poor man for his poverty,

nor pardoned a rich man for his great goods and riches.

Golden Book, xlvii.

As you from crimes would pardon'd be,

Let your indulgence set me free.

Shak., *Tempest*, Epil., I. 19.

The shepherd rais'd his mournful head.

"And will you pardon me?" he said.

Prior, *Despairing Shepherd*.

3. To excuse; indulge; especially, to excuse

from doing something.

Thrice-noble lord, let me entreat of you

To pardon me yet for a night or two.

Shak., *T. of the W. Ind.*, II. 121.

Those who know how many volumes have been written

on the poems of Homer and Virgil will easily pardon the

length of my discourse on Milton.

Addison Spectator, No 371.

Pardon me, forgive me; excuse me; a phrase used when
one makes an apology, and often when one means civilly
to deny or contradict what another affirms: as, *pardon me*,
but I think you are mistaken: often abbreviated to *pardon*.

And I

(Pardon me saying it) were much loath to brood

Dispute betwixt myself and mine.

Tennyson, Princess, I.

= *Syn. Pardon, Forgive*. These words are often synony-
mous. Strictly, *pardon* expresses the act of an official or
a superior, remitting all or the remainder of the punish-
ment that belongs to an offense. as, the queen or the gov-
ernor pardons a convict before the expiration of his sen-
tence. *Forgive* refers especially to the feelings; it means
that one not only resolves to overlook the offense and re-
establish amicable relations with the offender, but gives
up all ill feeling against him. See *pardon*, *n.*

perdonum, indulgence, pardon; from the verb.]

1. Forgiveness of an offender or of his offense

or crime; a passing over without punishment;

remission of penalty.

Very frankly he confess'd his treasons

Imp'd and your highness' pardon, and set forth

A deep repentance.

Shak., *Macbeth*, I. 4. 6

Humbly their faults and pardon begg'd

Milton, *P. L.*, x. 1101.

Grant me pardon for my thoughts.

And for my strange petition I will make

Amends hereafter.

Tennyson, Gerald.

2. In law, a free remission of the legal conse-
quences of guilt or of some part of them; an act
of grace proceeding from the power charged
with the execution of the law, which exempts
the individual on whom it is bestowed from the
punishment the law prescribes for a crime he
has committed. *Marshall*. More mitigation of

punishment is not pardon. Pardon is sometimes used
in the more general sense which includes amnesty. In
Great Britain the pardoning of offenses against the crown
or the people rests with the crown, except in certain spe-
cial cases. Pardon is granted under the great seal or by
warrant under the sign manual, counterseigned by one of
the principal secretaries of state, or by act of Parliament.
Offenders against the laws of the United States may be
pardoned by the President, except in cases of impeach-
ment. In nearly all the States, persons convicted of
crimes under the State laws, except in cases of treason
and impeachment, may be pardoned by the governor, the
governor and council, or the governor and board of pardon.

John Hunne had his Pardon, and Southwell died the
Night before he should have been executed.

De Witt, Chronicle, p. 27.

3. The deed or warrant by which such remis-
sion is declared. Delivery is essential to its validity,
and delivery is not complete without acceptance; but in
some cases constructive acceptance has been held suffi-
cient, as where it was delivered to the jailer, the prisoner
being ignorant of it.

4. A papal indulgence, or remission of the
temporal punishment due to sin, usually for a
stated time.

Do le and do penances day and night evers,
And purchase all the pardon of Pampilon and of Rome,
And indulgences ynowe.

Piers Plowman (C), xx. 112.

Thrice he promised he would bring them all pardons

from Rome.

Morne, Sentimental Journey, p. 24.

To quicken the faithful in the discharge of such a brotherly
kindness, our old English bishops often granted a
ghostly reward - an indulgence, or, as it was then better
called, a pardon of so many days - unto all those who with
the fitting dispositions should answer this call made to
them from the grave, and pray especially for him or her
who lay buried there.

Quoted in *Book of our Fathers*, III. 1. 72.

5. Allowance; excuse.

I begg'd

His pardon for return.

Shak., *A. and C.*, III. 6. 60.

No youth can be comely but by pardon, and considering
the youth as to make up the comeliness. *Bacon*, *Beauty*.

To beg, crave, or ask one's pardon, to ask one's for-
giveness: a phrase corresponding in use to *pardon* *me*
(which see, under *pardon*, *c.*) = *Syn. Pardon, Absolution,*
Remission, Amnesty. All these words represent a com-
plete work with reference to the offense, so that it becomes
as though it had not been committed. Pardon is the gen-
eral word (see comparison under *pardon*, *c. l.*). *Absolu-*
tion is now strictly an ecclesiastical word, as defined,
Remission is, by derivation, a letting go, a sending away;
remission of sins is a frequent Biblical expression; out-
side of Biblical language, we speak chiefly of the *remission*
of penalty, as, the *remission* of a fine or of part of a term
of imprisonment. *Amnesty* is strictly a political word, as
defined, covering a general pardon of persons, named or
unnamed, who have become exposed to penalty by offenses
against the state or the sovereign. We speak of *pardon* of
the offense or the person; *absolution* of the person from
the offense; *remission* of sin or of penalty for the person;
amnesty to all concerned in the insurrection.

Such persons would be within the general pardoning
power, and also the special provision for *pardon* and *am-*
nesty contained in this act. *Lincoln*, in *Raymond*, p. 202.

The blackest sin is clear'd with *absolution*.

Shak., *Lucrece*, I. 254.

Almighty God . . . hath given power and command-
ment to his ministers to declare and pronounce to his
people, being penitent, the *absolution* and *remission* of
their sins.

Book of Common Prayer, Absolution.

All peace implies *amnesty*, or oblivion of past subjects
of dispute, whether the same is expressly mentioned in
the terms of the treaty or not.

Woddy, Intrud., to *Inter. Law*, § 122.

Jer. Taylor, *Works* (ed. 1833), I, 30.

-Syn. 1. *Pare*, *Peel*, *Shave off*. To *pare* is to remove the
surface only with a knife or similar instrument; to *peel* is
to pull off the skin or rind. "That is *pared* which is de-
prived of a natural layer or integument spread over it."
(C. J. Smith, *Synonyms* (disseminated), p. 602.) The figure-
ative use of these two words are limited. *Shave* or *shave*
of still seems figurative when not implying the use of a
razor, and is controlled in its meaning by that original

sense; hence it is always limited to dressing off the sur-
face.

from several plants. The true *pareira* (fully writ-
ten *pareira* *brava*) is the root of *Chondrodendron tomentosum*,
formerly supposed to be afforded by *Chondrodendron* *pareira*,
which is hence called *spurious pareira brava*. The latter
has a local medicinal use. There are several substitutes
for *pareira brava*, some of them worthless. The genuine
is regarded as a mild tonic, aperient and diuretic but its
chief use at present is to relieve chronic diseases of the
urinary passages. *Pareira-root* is the official drug, but
pareira-bark has probably something of its virtue. See
abutilum.

toward the close of the fourteenth cen-
tury, reached the ground (or near it)
behind; it was usually cut shorter in
front; it sometimes had long and flow-
ing sleeves, and these and the edges of the
robe were commonly ornamented with
dags, scallops, or the like. The whole
was usually made of some silk fabric, to
some extent impermeable to rain.

(b) The undifferentiated body-substance or
chyme-mass of the unicellular animal, as an
infusorian, indistinguishable cell-substance;
endoplasm. (c) The general substance of the
interior of the parenchymatous worms.—2. In
bot., the fundamental cellular tissue of plants;
contradistinguished from *prosenchyma*, or fibro-
vascular tissue. It is the soft thin walled tissue, with
approximately isodiametric cells, which composes the soft
pulp of leaves: between the network of veins, the pulp of
fruits, etc. In a dicotyledonous stem it forms the outer
bark, the pith, and the medullary rays, in monocotyledons
it is the common mass of loose texture, through which the
definite fibrovascular bundles are distributed. While the
ordinary or typical shape of the cells is polyhedral or spher-
oidal there are numerous modifications, all of which for-
mally received special designations, but only a few prin-
cipal types are now distinguished by names. Spongy paren-
chyma is tissue in which the cells are loosely aggregated
and have large intercellular spaces. Elongated paren-
chyma cells are more compactly combined than spongy ones,
and in the upper side of leaves have received the signifi-
cant name of *palisade-cells*. Flattened parenchyma-cells
are seen in the medullary rays of dicotyledons. Collo-
chyma, sclerotic and suberous parenchyma, trichomes,
etc., are further modifications. See *collenchyma*, *palisade-*
cell, *sclerotic*, *suberous*, *trichome*, and *cutis* under *cellular*,
epithelial, and *tissue*.

worms, being those which have no intestines,
but are solid or parenchymatous. They were di-
vided into four families—*Aranthophoridae*, *Trematodae*,

the composition of the order nor its subdivision cor-
responds with natural groups.

helia are seen at the same time; and variously arranged white circles, arcs, and bands intersect the halo, or lie tangent to it at the same points. Halos are produced by the refraction of rays through suspended ice-crystals which tend to fall in one or more special positions, and parhelia are due to the excess of crystals so situated. When the sun is near the horizon and the ice-prisms in a vertical position largely preponderate, parhelia are formed on the halo both to the right and left of the sun, and at the same level. As the sun rises, the parhelia gradually separate outward from the halo. If there is an excess of hexagonal prisms with their axes horizontal, and if the axes of the prisms are perpendicular to the line joining the sun and the observer, parhelia will be produced which will be situated on the halo above and below the sun.

2. A meeting or assembly for conference or deliberation; especially, an assembly of the people or their representatives to deliberate or legislate on national affairs. The word is nearly confined to the legislative bodies of Great Britain and its colonies. Sometimes it is used with reference to other countries, as the German *Parlament* of 1848, the Italian *Parlamento*; usually the word *diet* or the native name is preferred, as the Hungarian *Diet*, the German *Reichstag*, the Norwegian *Storting*, etc.

Specifically - 3. [*cap.*] The supreme legislative body of the United Kingdom of Great Britain and Ireland, consisting of the three estates of the realm, namely the lords spiritual, the lords temporal, and the commons; the general council of the nation, constituting the legislature, summoned by the sovereign's authority to consult on the affairs of the nation and to enact and repeal laws. Primarily, the sovereign may be considered as a constituent element of Parliament; but the word as generally used has exclusive reference to the three estates above named, ranged in two distinct branches, the House of Lords and the House of Commons. The House of Lords includes the lords spiritual and lords temporal. (See *House of Lords*, under *lord*.) The House of Commons consists of 670 members: viz., for England and Wales, 358 representatives of county constituencies (counties or divisions of counties), 27 of boroughs, and 6 of universities; for Scotland, 36 representatives of counties, 31 of burghs, and 2 of universities; for Ireland, 35 representatives of counties, 16 of boroughs, and 2 of a university. The authority of Parliament extends over the United Kingdom and all its colonies and foreign possessions. The duration of a Parliament was fixed by the Septennial Act of 1716 at seven years, but it seldom even approaches its limit. Sessions are held annually, usually from about the middle of February to the end of August, and are closed by prorogation. Government is administered by the ministry (see *ministry* and *cabinet*), which is sustained by a majority in the House of Commons. Should the ministry be outvoted in the house on a question of vital importance, it either resigns office or dissolves Parliament and appeals to the country. The precursors of the Parliament were the Witenagemot in the Anglo-Saxon period and the National Council in the Norman and Angevin periods. The composition and powers of Parliament were developed in the thirteenth and fourteenth centuries; the right of representation from shires and towns dates from 1265, and the separation of the two houses dates from the middle of the fourteenth century. Parliamentary government was in large measure suspended from 1461 to the middle of the reign of Henry VIII. Prolonged struggles between the Parliament and the crown took place under James I. and Charles I., which led to the Civil War and the Commonwealth. The Triennial Act of 1694 (modified by the Septennial Act of 1719) fixed the life of Parliament at three years, and government by party dates from the same period. The right of election to Parliament has been greatly modified by the Reform Acts of 1832, 1867, and 1884, and the Redistribution Act of 1885.

I find that you have made choice of me to be one of your Burgeesses for this now approaching *Parliament*. *Howell, Letters*, I. v. 4.

4. [*cap.*] One of similar legislative bodies constituting the legislatures of the Dominion of Canada, the Commonwealth of Australia, and other self-governing colonies of the British empire. The Parliament of the Dominion of Canada, established by royal proclamation in 1867, consists of two houses - a Senate, or upper house, whose members, 44 in number, are nominated for life by the governor-general, and a House of Commons, whose members are elected for

five years by the people of the different provinces, there being one representative for every 22,000 of the population. In the other colonies the two houses are usually styled the *Législative Council* and the *Législative Assembly*. The members of the latter body are elected; the members of the former body may be elected, as in Tasmania, or nominated by the crown, as in New South Wales.

Act of Parliament, a statute, law, or edict made by the sovereign, with the advice and consent of the lords temporal and spiritual and the commons in Parliament assembled. In later times, the phrase is more commonly used of either house, or both houses, acting in the exercise of judicial or quasi-judicial functions, such as the inquest by the Commons and the trial by the Lords of an impeachment, or the action of either house, or both successively, on a bill of attainder, a question of contempt, the removal and punishment of public officers, etc., as distinguished from functions of legislation and functions of a council of the king.

parrot (par'it), *n.* [formerly also **parroture**, **parret**, **parrotet**, **parat**: supposed to be, like **F. pierrot**, a sparrow, < **F. F. parrakeet**: see **parrakeet**. Cf. **pet-rell**, **mugli**, **muggie**, **jack**, 10, **jackdaw**, **robin**, etc., names of birds from names of persons.]
1. Any bird of the family **Psittacidae** or order **Psittaci**; a zygodactyl scansorial bird with a cere and hooked bill. **Parrot** is the general name of all such birds, various kinds of them being called **cockatoos**, **macaws**, **parrakeets**, **lories**, and by many other

more specific names. When used in a stricter sense, it usually refers to Old World birds of moderate or rather large size, of stout build, with strong beak, fleshy tongue, and short square tail, as in the restricted genus *Psittacus*, of which the African *P. erythreus*, of a gray color with a bright-red tail, is a characteristic example and one of the commonest of cage-birds. The natural cries of parrots are, as a rule, extremely loud and harsh; but many of the fleshy-tongued species can be taught to articulate words and even sentences in a perfectly intelligible manner. Most parrots are expert climbers, and in scrambling about use the bill as well as the feet, the upper mandible being peculiarly movable. The tongue in some species is also used as an organ of touch, almost of prehension, objects being often held and handled between the tip of the tongue and the hook of the beak. These birds are mostly vegetarian, feeding upon seeds and especially soft fruits, but some are carnivorous. Their temper is ungainly, though several kinds exhibit the most affectionate and gentle disposition, at least toward one another. In size and shape parrots differ greatly, more than is usual among the representatives of any one family of birds: some of the smallest species are no larger than sparrows, as those of the genus *Nannurus*, while the great macaws attain a length of about three feet. Their coloration is equally diversified: some are black or gray; some are snowy-white; green is the most characteristic color; yellow, red, and blue, often of the most brilliant tone, are very common; and many parrots are variegated with all these colors. The sexes are usually colored alike. Qualities of coloration reach their extreme in the macaws, while the most beautiful and dainty tinting is common among the lories, and plain or rather shades are exceptional throughout the order. Of parrots of all kinds there are about 350 species, classed in from 35 to 100 genera according to the views of different ornithologists. They abound in all tropical countries, but seldom extend into temperate countries, except Australia and New Zealand. In island numbers the geographical distribution of parrots is as follows: America is richest in species, having 154, only one of which occurs in the United States, though two or three others come nearly or quite to the Mexican border; the Moluccas and Papuan islands have 80 species, Australia 65, and Polynesia 3. 2 are African; and 31 are peculiar to Asia. See also rats under *Canidae*, *Columba*, *Cordia*, *Euphonia*, *macaw*, *Micropodidae*, and *Myristicivora*.

sentative example of the *Oscines* or normal *Passeres*. The name *Passer*, or was used with little discrimination, for a century, but is now in nearly universal use for that genus of finches which contains the common European or so-called English sparrow (*P. domesticus*), the European tree sparrow (*P. montanus*), and several other closely related species. The two species named are both naturalized in the United States. See *sparrow* and *house-sparrow*.

The common savanna-sparrow is *P. savanna*, and there are several others. They are ground sparrows, and especially abundant in low moist localities.

Passerella (pas-ér-el'á), *n.* [*NL.* (Swainson, 1837), dim. of *L. passer*, a sparrow: see *Passer*.] A genus of large handsome fox-colored fringilline birds of North America, having enlarged feet; the fox-sparrows. *P. iliaca* abounds in shrubbery in most parts of eastern North America, and several other species of varieties are found in the west. See *sparrow*.

Passerellinae (pas-ér-el'í-né), *n. pl.* [*NL.* (S. F. Baird, 1858), < *Passerella* + *-inae*.] A sub-family of *Fringillidae*, named from the genus *Passerella*, having no definable characters.

Passeres (pas'ér-éz), *n. pl.* [*NL.*, pl. of *L. passer*, sparrow: see *Passer*.] An order of

class *Aves*, typified by the genus *Passer*, comprehending more than half of all birds. It has about the same amount of classificatory value of groups called families in departments of botany other than ornithology. It corresponds exactly to *Insectes* in some of the uses of this word, and exactly to the Cuvierian *Passerina* as extended by Blyth; also to the *Alphapasserina* of Harley. It consists of the *Ocineas* (Müller) and *Columbarina* of Cabanis. With some exceptions, these birds (numbering upward of 4,000 species) have the following characters. They are monogamous, having no auxiliary muscles nor accessory femorotarsal. The femorotarsal and semitendinous muscles are present, as is usually also the accessory semitendinous. The flexor longus hallucis, the muscle which bends the hind toe, is separated from the flexor longus digitorum, which bends the other toes collectively; and the hind toe is inserted low down, or is perfectly insubstantial. The result of this is that the feet are perfectly fitted for grasping slender supports, and the birds are then typically insectivorous. Furthermore, the toes are always 4, 3 in front and 1 behind (except in *Chalcophaps*); none are vestigial to their normal position, and the ratio of their phalanges is always 2, 3, 4, 5, counting from the first to the fourth digit. As to the means of flight, of which no *Passeres* are deprived, the sternum has with few exceptions a particular conformation, being notched on each side behind, manubriated, and provided with prominent costal processes; the tenor palatilis brevis has a special mode of insertion; the primaries are either 10 or 9 in number, the secondaries are more than 6, and the greater coverts are not more than half as long as the secondaries. The tail has 12 rectrices (with few exceptions). The palato is elongated; the covering of the bill is hard, with a core or other soft membrane, and the nostrils do not openly communicate; the oil-gland is nude; the ova are 2 in number; and the carotid is single and unilateral. *Passeres* are altricial and peltopedic, the young being born helpless and naked. In most birds of this order the lower larynx, or syrinx, is highly developed as a musical organ, and according to this character *Passeres* are divisible into 2 primary groups (*Ocineas* or *Acromyodictes*, and *Columbarina* or *Meomymodictes*). The division of *Passeres*, however, has severely exercised alike the erudition and the ingenuity of the systematists, and no proposed method is fully accepted. The prime division by Gmelin and Forster, into *Emberizodactylus* and *Donniodactylus*, is superficial, since those alleged *Passeres* which are demonstrably not *Passeres*. Elimination of these obstructive terms leaves the prime division as before, into *Acromyodictes* and *Meomymodictes*. In 1874 Wallace divided *Passeres* upon external characters into 4 series: (1) *turdoid*, with 21 families; (2) *tanagroid*, with 10 families; (3) *sturnoid*, with 4 families; (4) *formicarioid*, with 10 families; 45 in all—an arrangement requiring some modification upon anatomical grounds. The monomyodictan *Passeres* are either (1) heteromeric, as the families *Columbarina* and *Pipridae*, or they are (2) homomeric. The latter are either (1) haplophomous, as the *Tyrannidae*, *Pittidae*, *Phalacroptidae*, and *Corvidae*, or they are (2) trichophomous, as the *Paridae*, *Pteropodidae*, *Dendroica*, *Corvidae*, and *Formicariidae*. With few exceptions, monomyodictan *Passeres* are American, and nearly all of these (all but a few *Tyrannidae*) are Central and South American. As to the acromyodictan *Passeres*, they are either abnormal or normal. The abnormal *Passeres* are only two Australian families, *Menuridae* and *Archaeidae*, together called *Psittaculidae*. The rest are *Ocineas* proper, some 4,700 species in all, so closely related that they scarcely represent a group of higher rank than the average "family" recognized by ornithologists. They are three of Wallace's four series (*turdoid*, *tanagroid*, and *sturnoid*), and are separated by Sundevall into *Columbarina*, *Columbarina*, *Columbarina*, *Columbarina*, *Columbarina*, and *Columbarina*. Schaler has six similar divisions, though in different order and under other names: *Dendroica*, *Lathyrus*, *Curtius*, *Tenax*, *Contra*, and *Ultrix*. These groups may be thus explained or illustrated: (1) *Columbarina* or *Dendroica*, thrushes, warblers, flycatchers, shrikes, etc.; (2) *Columbarina* or *Curtius*, crows, jays, tits, etc.; (3) *Columbarina*, finches, buntings, sparrows, tanagers, etc.; (4) *Columbarina* or *Tenax*, honey-suckers; (5) *Columbarina* or *Ultrix*, creepers; (6) *Columbarina* or *Lathyrus*, swallows. All these birds agree in being lamniphilous; and among them or near them must be found or made a place for the larks, *Alaudidae*, which are acanthiphilous, and which, when not placed with *Contra*, form a seventh superfamily known as *Corydomorphae*.

passeriform (pas'e-ri-fôr'm), *a.* [*C. N. L. passeriformis*, *C. L. passer*, sparrow, + *forma*, form.] Sparrow-like in form or structure; pertaining to ocine *Passeres* or *Passeriformes*, or having their characters; passerine in a s. sense.

See cat in next column, and cat under indigo-bird.

2. A genus of beech-like shrubs, of the spectral order *Thymelaeaceae* and the tribe *Euthymelaeae*, known by its four-lobed unappendaged urn-shaped calyx, eight exerted stamens, and its obscure stigma. As thus constituted, it was a thoroughly unnatural group, subdivided in an equally artificial manner. But removing from it certain heterogeneous elements, as *Cypselus*, *Cypselus*, *Podiceps*, *Colinus*, *Corvus*, *Cypselus*, *Podiceps*, *Colinus*, *Corvus*, *Cypselus*, *Podiceps*, etc. (as was done by Blyth, Cuvier's editor in 1846), it represents the *Passeres* of modern naturalists.

Passiflora (pas-i-flô'rah), *n.* [*N. L. (Linnaeus, 1737)*, irreg. *C. L. passio*, passion, + *flor* (flor-), flower. Early missionaries to South America, and Spanish writers from 1503, regarded the flower as an emblem of the crucifixion, finding in the five anthers the five wounds, in the three button-like stigmas the three nails, in the coronate crown of thorns, in the five petals and five sepals the ten apostles then present, in the digitate leaves the persecutors' hands, and in the tendrils their scourges.] A genus of climbing herbs or shrubs, type of the order *Passifloraceae* and the tribe *Passiflorae*, characterized by the short calyx-tube, three styles, and the calyx-lobes, petals, and stamens each four or five; the passion-flowers. There are about 175 species, mainly American; a few are Asiatic and Australian. They bear lateral unbranched tendrils, and alternate leaves undivided or lobed, often with a gland bearing petiole. It is characterized by the undivided or three- to five-parted style, four to many stamens, similar petals and sepals, and especially by the corona, of one, two, or many rows of filamentous bodies, or a tubular membrane, seated on the calyx-tube or between the petals. It includes about 235 species, mainly tropical, especially of South America, classed in 6 tribes and 27 genera, of which *Passiflora* (the type), *Carex*, *Jacaranda*, and *Tecoma* are the chief. passing-bell (pās'ing-bel), *n.* A church bell
tollled at the time of a person's death or imme-
diately after. It was a means of summoning Christians
to pray for the soul of the one just departed; and it is
still common as a mark of respect to the dead and an an-
nouncement to the public that a death has just occurred.
The age of the person is commonly indicated by the
number of strokes. This custom is supposed to have
originated from the ancient belief that the sound of the
church bell drove away any demon that might seek to take
possession of the departing soul. In the Church of Eng-
land it is enjoined by canon that the *passing-bell* be
tollled during the dying and at the burial of any parish-
ioner. Formerly called *farth fare*.

one, still leaves him his self-control. The secondary mean-
ings of the two words keep this difference.

Brevitatives, solos, duets, choruses, and even instrumental numbers, are employed as in other oratorios, but, at least in the German passion, the liturgical style controls every element; hence chorals are often introduced for the use of the congregation or audience. The most noted example is the "Passion according to St. Matthew" of J. S. Bach. Also called *passion-oratorio*, or simply *passion*.

An annual feast of the Jews, instituted to commemorate the escape of the Hebrews in Egypt, when (God, smiting the first-born of the Egyptians, "passed over" the houses of the Israelites, which were marked with the blood of the paschal lamb. It was celebrated on the evening of the 14th day of Abib or Nisan, the first month of the sacred year. The name is also used by extension to include the seven days that followed (from the 15th to the 21st of Nisan), during which the Israelites were permitted to eat only unleavened bread; and hence the Passover is also known as the "feast of unleavened bread." Every household with his family ate on the first evening a lamb killed by the priest (Ex. xii.), which was served up without breaking the bones.

And ye shall observe this thing for an ordinance to thee and to thy sons for ever. . . . And it shall come to pass, when your children shall say unto you, What mean ye by this service? A document issued by competent civil authority, granting permission to the person specified in it to travel, or authenticating his right to protection. In some states no person is allowed to leave the country without a passport from his government, but the regulations of different jurisdictions regarding the use of passports have varied much, and of late years have exhibited a tendency toward a relaxation

of stringency, extending in many countries to their total abolition. Passports must give a description of the person. Those of the United States (1907) "request all whom it may concern to permit . . . safely and freely to pass, and in case of need to give (him) all lawful aid and protection," and are given under the seal of the Secretary of State. Passports may be given for goods as well as for persons; and in time of war a ship's passport is a voucher of her neutral character.

The epithets *hard* and *soft* have reference to the power of resisting heat, hard-paste porcelain supporting and requiring a much higher temperature than the other. The virus, in its different degrees of virulence, is obtained from the spinal cord of rabid rabbits which have acquired the maximum intensity of the disease after a repeated transference of the virus from one animal to another. Sections of the cord free from foreign germs are allowed to remain, for different periods of time, in a sterilized and dry atmosphere, whereby the virulence of the virus becomes progressively diminished, until it is finally completely lost.

-Syn. *Pastime*, Amusement, Recreation, Diversion, Entertainment, play. The balladized words keep near to their meaning by derivation. The central idea of a *pastime* is that it is a positively agreeable that it lets time slip by unnoticed; as, to turn work into *pastime*. Amusement has the double meaning of being kept from amuse and of finding occasion of mirth (see *amuse*). Recreation is that sort of play or agreeable occupation which refreshes the tired person, making him as good as new. Diversion is a stronger word than recreation, representing that which turns one aside from ordinary serious work or thought, and amuses him greatly. Entertainment has come to have great breadth, ranging from amusement in its narrower sense to diversion and to the idea of a set exercise, as a concert, or to the articles of food furnished to guests; generally, however, *entertainment* stands for that which is social and refined.

pâte (pât), *n.* [*F. see pâte*.] *Pâte sur pâte*, in *crème*, decoration by means of fine enamel or porcelain paste applied upon a previously prepared surface so as to produce a very low relief. It differs from *sopra bianco* or *albugine* decoration in that it is treated as sculpture, the relief itself being the object aimed at. In the finest work the applied paste is always pure white, and, as it comes upon a darker ground, the different degrees of thickness of the paste give different degrees of translucency and of whiteness. In inferior work the modelling is done without the same care for gradual thickness, and shade is produced by a gray tint. See *Salon porcelaine*, under *porcelaine*. *Pâte tendre*, soft paste in porcelain: the French name, often used in English.

pâte (pât), *n.* [*F. see pâte*.] 1. A small pastry.—2. In fort., a kind of platform, usually of a roundish or oval shape, erected on marshy ground to cover a gate.—*Pâte de foie gras*, or *Strasbourg pâté*, a pastry made of fat geese-livers, impaled principally from Strasbourg in little stone pots. Properly the contents should be taken out and served in a crust of pastry, but the name is usually given to the original preparation.

Do you surmise, O shallow-pated men,

That this excuse is all sufficient

To satisfy for such a foolish intent?

pâtée (pa-tâ'), *a.* See *pâté*.

patefaction (pat-fak'shon), *n.* [*L. patefactio*], a laying open, a making known, *< patefactio*, throw open: see *patefy*. The act of opening or manifesting: open declaration.

For our sight of God in heaven: all place our sphere is heaven itself, our medium is the patefaction, the manifestation, the revelation of God himself, and our light is the light of glory.

Donne, *Sermons*, 111.

patefy (pat-fî), *v. t.* [*L. patefacere*, throw open, reveal, *< patere*, lie open, + *facere*, make, do: see *patent*]. To reveal; show; declare.

(a) As originally constituted and retained by Linnaeus it was a very heterogeneous assemblage of all forms having a patelliform shell, and embraced besides all the *Dissipatus*, *Pranulidae*, *Anoplate*, *Calyptrae*, and related forms. (b) It was subsequently gradually restricted and limited to discoglossate shells. (c) Later writers it has been confined within narrow bounds and to such species as have an oblong cone shell entirely open below like an inverted basin, and with no aperture at the apex, the true limpets, as those named in the English conchology. See also cut under *patelliform*.

(a) Including such limpets as are otherwise separated as *Acmacras* (false limpets) and *Lepetidae*. (b) Restricted to the true limpets. The animal has gills forming a row of leaflets around the foot and the lingual ribbon has one or two lateral teeth and three marginal on each side. The shell is a flattened cone, open below, and has a horseshoe-shaped impression on the inside, open in front. These limpets are numerous in species and widely distributed. They live in general on rocky coasts, or as a place for themselves on some rock where for the most part they rest, but where they make excursions for food, chiefly at night.
